The rise of sweatshops and home-based industrial labor in developing as well as industrialized countries has further disadvantaged women’s role in the labor market, as they force women into particular niches, with low pay, low skills, and poor working conditions. Often this involves doing repetitive, highly routinized, and regulated jobs on assembly lines; some believe that women are well-suited to these jobs because of their supposed inherent docility and dexterity and ability to do monotonous and labor-intensive jobs. Many labor-intensive, light manufacturing industries such as the garment, footwear, and electronics industries employ women rather than men because they make higher profits with a female workforce.

A further impact of globalization can be felt through the process of racialization of women’s work as well: Caribbean or Filipino women as domestic workers, Chinese or South Asian women as garment workers.
Indeed, studies indicate that a large number of women of color are clustered in low-income sectors in countries such as Canada or Britain (Sassen 1998; Jackson 2002). These women, especially immigrant women in developed countries, are low paid, receive no benefits, and are left with little in the way of social security, labor standards, or other state guarantees. Thus women of color are systematically excluded from the better paid, secure, and the more desirable jobs in the labor markets. Despite a major increase in women's labor-force participation, the intersectionalities of gender, class, and race continue to stereotype the women's labor force and affect the employment trajectories of women in the capitalist world economy.

WORK DAY

The current concept of the work day did not exist prior to the modern age. Before the Industrial Revolution work was an integral part of life. What we know today as leisure and work were mixed thoroughly. As late as the colonial period in American history daily work schedules were casual, set by custom rather than by contract, law, or the clock.

The work day in colonial America traditionally ran from dawn to dusk six days a week. However, meals and rest breaks customarily accounted for two and a half to three hours of that long day. In addition, the work day was casual, interspersed with non-work activities such as conversations, household chores, games, and simple idleness.

THE SEPARATION OF WORK AND LIFE

As the marketplace became increasingly rationalized and the factory system grew, competition forced labor to become more efficient. Work increasingly was purged of its nonproductive elements. The clear division between work and life fundamental to the modern definition of the work day emerged in the United States around the turn of the nineteenth century. Impersonal market forces transformed casual preindustrial work patterns. Wages replaced older kinds of traditional compensations such as masters’ support of and guarantees given to apprentices and journeymen.

Having to pay daily wages, masters, managers, and contractors tried to increase profits by intensifying work effort and expanding the customary dawn-to-dusk work day to the limits of human endurance. By the 1830s traditional artisanal republican workshops were well on their way to being replaced by what commonly was called a “bastard system of production.” As manufacturing was increasingly rationalized, what Karl Marx called in his Communist Manifesto the “motley feudal ties” ([1849] 1906) that had connected owner to operative fell away, replaced by impersonal market relations that often exploited workers in a kind of wage slavery that many, including Walt Whitman, likened to the experience of African Americans in the American South.

ATTEMPTS TO REDUCE THE WORK DAY

Initially workers struggled against the advent of modern work discipline. Gradually, though, as E. P. Thompson showed, workers accepted the division of work from life, but then began a new “fight … about” time (Thompson 1967, p. 85). For over a century workers attempted to reduce the working day, week, year, and life to reclaim in their leisure the conviviality, creativity, equality, independence, and citizenship that characterized the essential republican virtues that once had been part of their jobs. The historians David Roediger and Philip Foner conclude that “the length of the workdays … has historically been the central issue raised by the American labor movement” (Roediger and Foner 1989, p. vii).

William Heighton articulated a worker vision of continual work reduction that endured for over a century. In a pamphlet circulated during the 1827 carpenters’ strike in Philadelphia for a ten-hour day, Heighton called for the work day to be reduced from “12 to 10, to 8, to 6, and so on” until “the development and progress of science have reduced human labor to its lowest terms” (Heighton 1827).

Organizing across craft lines and hoping to influence customary standards and new contracts, workers pressured politicians to pass ten-hour laws for government...
employees. Various cities and states considered or passed such legislation. The process culminated in 1840 with President Martin Van Buren's executive order granting the ten-hour day to manual workers under government contract.

After the Civil War labor turned its attention to the eight-hour day. As Karl Marx observed, the issue “ran with the seven-league boots of the locomotive from the Atlantic to the Pacific, from New England to California” (Marx 1906, p. 329). The eight-hour day became an important political issue, finding a place in the Omaha platform of the Populists and the Bull Moose platform. The Democratic and Republican platforms in 1932 called for reductions in the work day to below eight hours. Some of the most dramatic and significant events in the history of labor, such as the strikes of 1886, the Haymarket disaster, and the steel strike of 1919, concerned the length of the work day. During Woodrow Wilson's administration, the eight-hour day became the national norm and Congress passed laws regulating the work day of children, women, and workers in hazardous occupations.

In the Great Depression, continuing their commitment to the “progressive shortening of the hours of labor,” unions supported the introduction of the Black-Connery bill setting the work day at six hours as a remedy for unemployment. The bill nearly passed Congress in 1933 and continued to be a key political issue until it was refashioned as the Fair Labor Standards Act and passed in 1938. The Fair Labor Standard Act set the standard work day at eight hours instead of six. Since then no advance has been made. No new laws reducing the work day have been passed. Labor seems to have lost interest. Now there is some evidence that the work day is lengthening and the eight-hour norm giving way. Overtime is growing. Salaried employees’ work days have lengthened. The work day in newly industrializing nations are at nineteenth-century U.S. levels (Hunnicutt 1996).

EXPLANATIONS OF THE LENGTH OF THE WORK DAY

Trying to account for the length of the work day historically through the use of traditional economic models of supply and demand is unrewarding. The oldest relevant economic model, dating back to the mercantilists of Thomas Jefferson's day, is an economic paradox. Unlike all other goods and services, the supply curve of labor was long understood to be “backward-bending.” For generations economists predicted that above a certain wage rate workers would offer increasingly less of their time to work; the work day would shrink naturally as workers chose to “buy back” their lives instead of continuing to work to purchase new, less desirable (by comparison) goods and services.

That theory was a good fit with the declining work day of the nineteenth and early twentieth centuries. However, economists such as Lionel Charles Robbins tried to amend labor supply theory in the 1920s, arguing that the substitution effect of higher wages offsets the income effect: A wage raise increases the cost of an additional hour of leisure, making the workers’ choice between additional, more expensive leisure and new purchases indeterminate. Whatever labor supply theory was tested for the remainder of the twentieth century, however, in most longitudinal studies the correlation between the work day and wages and unemployment (unemployment rates are understood as a proxy for the demand for labor) was found to be insignificant.

Indeed, in 1998 Dora Costa argued that the length of the work day has not decreased as much for the highest-paid workers as it has for the lowest-paid. Economists such as Juliet Schor (1991) agree, demonstrating that salaried employees’ work days have lengthened well beyond eight hours in corporate cultures that pressure workers to expand the work day to extreme limits. Observing these developments, some might theorize with Karl Marx that the expanding work day reflects the capitalist tendency to maximize surplus value and hence profits by lengthening the work day. Others may understand the progressive shortening of the hours of labor as a fundamental threat to capitalism. As Herbert Marcuse observed in 1966:

[A]utomation threatens to render possible the reversal of the relation between free time and working time: the possibility of working time becoming marginal and free time becoming full time. The result would be a radical transvaluation of values, and a mode of existence incompatible with the traditional culture. Advanced industrial society is in permanent mobilization against this possibility. (Marcuse 1966, p. vii)

For whatever reason, the century-old vision of industrial progress as consisting of both higher wages for the finer things in life and shorter work days to enjoy them seemed to have been lost at the turn of the twenty-first century.

WORK WEEK

Annual hours of paid work increased substantially in much of the second half of the twentieth century due to more hours in a work week and more weeks worked. Economic sociologist Juliet Schor has sparked a national debate about work and time use with her best-selling books. For instance, in 1991 Schor reported that on average, men worked 43 weekly hours in 1969 and 43.8 hours in 1987. The corresponding increase for women was 35.2 to 37 hours. According to a study by Peter Kuhn and Fernando Lozano 18.5 percent of American men worked over 50 hours per week in 2001 (2005). In addition, with the increasing number of service sector jobs in the United States, “shift workers” have become more prevalent. A shift worker is at work during something other than a typical nine to five business day. According to numerous studies, workers keeping odd hours are more likely to have sleep difficulties and health problems.

The work week is also longer for many Americans due to urban expansion and increased commute times. In order to purchase larger houses in upscale neighborhoods with strong schools, many Americans have moved farther from their employer, therefore spending more time traveling to work each day. This trend suggests that Americans have less leisure time, and live with a rather frenetic pace of life. A number of surveys report that Americans would prefer shorter work weeks, but they do not want a lower standard of living. Increased time on the job generates income for the family, but a longer work week and commute further reduce the time workers have with their families.

Some statistics counter Schor’s findings. The Current Employment Statistics compiled by the U.S. Department of Labor’s Bureau of Labor Statistics reveal a decline in the length of the work week across all private sector jobs, from nearly thirty-nine hours in the mid-1960s to thirty-four hours in the early twenty-first century. This change is largely fueled by sharp decreases in average weekly hours in retail and services, sectors that have expanded substantially over the last half of the twentieth century, and that employ many part-time workers. In contrast, weekly hours worked in manufacturing have stayed fairly constant at forty-one hours during this time period. In addition, many professional and managerial employees are expected to work more hours than a standard full-time schedule.

Changes in the work week arise from a number of factors, including company policies. During recessions, firms regularly lay off workers (sometimes closing entire plants) to cut costs and manage inventories. The recession of the early 1980s saw many layoffs, but during the economic recovery that followed, firms did not rehire many workers. Instead, many firms added more overtime for existing workers. Indeed, there has been a general increasing trend in average manufacturing overtime from 2.5 hours in 1960 to 4.6 hours in 2000.

Largely due to higher health costs, benefits as a share of compensation have generally increased over time as well. According to the U.S. Department of Labor’s Bureau of Labor Statistics’ National Compensation Survey, at the beginning of the twenty-first century benefit costs comprised nearly 30 percent of total compensation. Benefits are fixed costs for employers, because they are paid once for each worker, and are not dependent upon how many hours an employee works. Therefore, high benefits costs deter businesses from adding workers.

Throughout the 1990s workers were increasingly paid on salary rather than with an hourly wage. This coincided with increased educational attainment, more professional occupations, and fewer manufacturing jobs. Salaried workers are required to work enough hours to keep their jobs, and the company culture reveals these expectations. For an employer, the cost of an additional hour of work from an hourly worker is the wage or the overtime wage. For salaried workers, the additional cost is zero. Salaried employees work longer hours in order to finish projects, to fit in the company culture, or to be productive enough to earn a promotion.

The structure of compensation has also changed, in that seniority-based pay is less common while pay for performance is more prevalent. Piece rates were the first form of incentive compensation, where employers tied pay to the amount a worker produced. Economist Edward Lazear presented the success of a piece rate system instituted at Safelite Glass, where both productivity and profit improved substantially. When workers face
schemes that tie their compensation to productivity, they have a clear incentive to put forth more effort and work longer hours (2000).

Government policies have also contributed to longer work weeks. For instance, caps on employer contributions to social security, unemployment insurance, and other business costs are based upon employee salary levels. In order to eliminate the funding gap for Social Security, it is possible employer contribution caps may be removed. But these sorts of tax caps clearly suggest that having fewer workers (even highly-paid workers) can lessen a company’s tax burden. This is an incentive not to hire more workers, but to keep existing employees working more hours. In addition, the Fair Labor Standards Act dictates overtime pay eligibility. Around the turn of the twenty-first century, more occupations became ineligible for overtime pay. Exempt workers include computer professionals, administrative workers, and some salespersons—all are occupations that employ many American workers. Thus, the cost to a company for an additional hour of work is further reduced.

The structure of the work week has also changed as a standard nine to five schedule became less common in the twentieth century. Some employers offer “flex time,” which is a schedule that involves some variable hours that workers can choose, according to their preferences. This is particularly valuable to employees with family commitments. Other nontraditional arrangements include the extended and compressed work week. The extended work week spreads the same amount of hours over more days, with shorter shifts. This is compared to the more common compressed work week, which includes longer shifts over fewer days. One particularly popular arrangement is four ten-hour days from Monday through Thursday, yielding an extended weekend. It seems that some employers understand workers’ desires to have flexible leisure time without sacrificing their standard of living.

In order to increase earnings, many workers have more than one job. According to the Bureau of Labor Statistics (2002), 7.8 million Americans (5.7 percent of the labor force) had multiple jobs in 2001, and the most frequently cited reasons for this were to earn extra money (35.4 percent of respondents) and meet expenses or pay off debt (27.8 percent). Schor states that workers are caught in a cycle of ever more spending and ever more working to cover their expenses. Labor economic theory generally assumes that workers select their optimal number of hours, but Schor argues that this is not the case. Instead, employers set the hours they expect from workers and their employees adjust accordingly.

WORKING CLASS
The capitalist class structure consists of two main classes: the capitalist class, owners of means of production, and the working class, owners of labor power. The relations between these classes are complementary and contradictory. Complementary, because capitalists need workers to produce the wealth they accumulate, and workers’ economic survival depends on capital investments: Lacking access to means of production, it is only through the sale of their labor power that workers and their families subsist. Their class interests are, however, inherently contradictory: It is in capitalists’ interest to lower production costs—that is, wages, pensions, health plans, and so on—to increase profits and facilitate capital accumulation. It is in workers’ interest not only to attain good wages and benefits but, eventually, to overthrow capitalism and take over the means of production, thus ending their exploitation by the capitalist class: The working classes are bound to become the capitalists “gravediggers” (Marx and Engels [1848] 1998).

HISTORICAL CHANGES AND THE WORKING CLASS
Karl Marx (1818–1883) and Friedrich Engels (1820–1895) wrote in the nineteenth century, when class differences were stark and the large and growing working class was composed of manual, mostly male workers.
Since then and up to World War II (1939–1945), workers lived close to the factories, in dense working-class communities. These conditions facilitated workers’ awareness of shared experiences and interests, and the formation of trade unions that enhanced workers’ economic and political power (Marx [1847] 1969, pp. 172–173). The concentration of capital and emergence of large-scale industry resulted in the spacial concentration of workers, giving “this mass a common situation, common interests. This mass is thus already a class as against capital, but not yet for itself. In the struggle … this mass becomes united, and constitutes itself as a class for itself. The interests it defends become class interests. But the struggle of class against class is a political struggle” (p. 173).

During the nineteenth and the first half of the twentieth centuries there were in the United States and Europe numerous instances of violent class struggles and widespread working-class mobilization and organizing under socialist, Communist, and anarchist banners: “social and cultural identities were forged by the categories of class and strata; everyday life, aesthetic expressions, and cognitive mappings articulated with production relations” (Aronowitz 1992, p. 23). In 1917 successful revolution in Russia seemed to confirm Marx and Engels’s prediction about the revolutionary role of the working class.

After World War II, however, the world’s economic and political conditions changed, partly as a result of the cold war and anticapitalist struggles in Asia, Africa, and Latin America. In the advanced capitalist countries, the working classes abandoned anticapitalist politics in exchange for steady employment and a good standard of living. Changes in the forces of production altered the economic and the occupational structures, decreasing the proportion of manual, “blue-collar” workers employed on farms and in the industrial, manufacturing sector. The proportion of workers employed in the service sector and in nonmanual, “white-collar” clerical, professional, and managerial jobs increased, thus giving rise to theories that conceptualized the top echelons of such jobs as a new class. Typical of such views is the “professional managerial class” (PMC) thesis put forth by John and Barbara Ehrenreich (1979). The PMC owes its existence to “the expropriation of the skills and culture once indigenous to the working class” (p. 2) and acts, with some degree of class awareness, in ways detrimental to the working class, leading to, for example, “the reorganization of the productive process, the emergence of mass institutions of social control, and the commodity penetration of working class life” (p. 18). Although professionals and managers may make decisions adversely affecting the working class, it remains open to debate whether such decisions reflect their own antiworking class intentions, or the objectives of the capitalist employers for whom they work. More important is the contention that the PMC is guilty of expropriating the workers’ skills and culture and that this expropriation constitutes a sufficient basis for considering them a social class. Historically, the development of capitalist industrialization has entailed the progressive deskilling of the working class and the emergence of a complex division of labor that includes deskilled masses of workers and layers of intermediate workers (foremen, managers, engineers, administrators, etc.), which embodied the power of capital and its ability to deskill and control the organization and pace of the labor process (see Braverman 1974 for a thorough analysis of these processes). The PMC is found not only in factories, of course, but also in all institutions where high-ranking salaried employees are the visible face of capitalist or of institutional power over rank-and-file workers. The view that the PMC is a “class for itself,” acting autonomously against the working class, overlooks the significance of its intermediate location, as employees who carry out the mandates of their bosses. The PMC can be viewed more appropriately as a strata within the propertyless class, occupying a “contradictory class location” between the capitalist class and the proletariat—that is, foremen, technocrats, bottom and top managers, and so on—and between the petty bourgeoisie and the proletariat—that is, semiautonomous employees such as teachers, professors, scientists, and so on (Wright 1978, p. 84). In other words, the PMC occupies the top layers in the social stratification of the working population; it is not a class but a social strata within the working class, objectively defined as the class of relatively privileged propertyless workers whose power and economic resources depend on their continued employment. Loss of a job can reduce them to poverty or near poverty because, barring individual exceptions, the members of the PMC do not own capital and depend on their salaries for their economic survival (Gimenez 1978).

In the last twenty-five years the rise and widespread use of information technologies and the increasing mobility of capital resulting in deindustrialization, downsizing, and outsourcing have further changed the occupational composition of the working classes, as well as their conditions of employment: Stable, relatively well-paid blue-collar and white-collar employment is becoming scarce, while contingent and temporary employment is increasing among low-skilled and highly skilled professional workers. Long-standing racial, ethnic, and gender conflicts—which have excluded women and nonwhite workers from well-paid, stable jobs and led to disproportionate female and nonwhite poverty—eventually in the last decades of the twentieth century spurred social movements for civil rights and equal opportunity for all. The politics of class, particularly in the United States, was replaced by identity politics.
ISSUES IN WORKING-CLASS SCHOLARSHIP AND POLITICS

The changing occupational composition of the working class, the decline in workers’ anticapitalist struggles and union membership, and the dominance of identity politics challenge the validity of the Marxist concept of the working class and its revolutionary potential. If narrowly defined as composed only of “productive workers,” that is, blue-collar workers producing surplus value (Poulantzas 1973, pp. 30–31), it would seem the working class is dwindling away within advanced capitalist countries. Reducing the working class to only skilled, craft workers, André Gorz argues that organizational and technological changes that have practically abolished skilled work have rendered obsolete the working class as a class composed of knowledgeable workers capable of taking over control of the means and the process of production; we must, therefore, bid “farewell to the working class” (Gorz 1982, p 46). If broadly defined, in terms of political allegiances, the working class could include everyone mobilized in struggles against the state. Rosa Luxemburg (1871–1919), for example, celebrated the spontaneous rising of the laboring masses composed of factory workers, rural proletarians, policemen, military personnel, and bank employees (Luxemburg [1906] 2004, p. 180). Historian E. P. Thompson (1924–1993) offered a dialectical understanding of the working class. Emphasizing process and agency, and arguing that class is a historical phenomenon, not a structure or a category, he states that “the working class was present at his own making” (Thompson 1966, p. 9). It is in the midst of struggles, as people sharing similar experiences become aware of common interests and enemies, that the working class “makes itself,” that “class happens” (p. 9). Thompson acknowledges, however, that common experiences, the basis for the emergence of class consciousness, are “determined by the productive relations into which men are born—or enter involuntarily. Class consciousness is the way in which these experiences are handled in cultural terms” (pp. 9–10). As culture (that is, institutions, value systems, beliefs, traditions, and so on) varies historically and cross-culturally, class consciousness, though it reflects an economically determined experience, is itself undetermined in its content; class struggles, it follows, can be fought under a variety of ideological legitimations.

Like Marx, who stressed the need to distinguish between changes at the level of production and the ideological ways in which individuals become conscious of those changes and engage in political struggles (Marx [1859] 1970, p. 21), Thompson differentiates between the determining role of productive relations and the contingent, cultural, or ideological forms that class consciousness might take. In Marx and Engels’s Communist Manifesto (1848), however, class consciousness—that is, workers’ awareness of their economic and political interests as a class that can succeed only by abolishing all classes, in the struggle to overthrow the economic and political power of the capitalist class—seems to flow unproblematically from the experiences of the working class. Capitalists require, in their economic and political struggles, the support of the working class; capitalists educate the proletariat and supply it with the political and economic know-how to fight and defend its interests as a class (pp. 18–19). Late-twentieth- and early-twenty-first-century capitalists, however, through the mass media and the democratization of consumption, seem to have established firm ideological control over workers’ consciousness, an unsurprising development because “the ideas of the ruling class are in every epoch the ruling ideas” (Marx and Engels [1845–46] 1947, p. 39). The lack of working-class mobilization and revolutionary upheavals in advanced capitalist social formations, and the successes of globalized capitalism, have undermined, among some academics and most left-leaning activists, the traditional Marxist analysis of the working class as the only revolutionary class, the only class capable of challenging the rule of capital (Marx and Engels [1848] 1998, p. 20).

The working classes of the twenty-first century are far less class conscious (in the sense indicated in the Manifesto) than they were a century ago. Recent social movements, the effects of racial, ethnic, and gender oppression and exclusion, have centered around inequality rather than exploitation. In their work, African American, Latino, and feminist scholars have examined the connections between class, gender, and race and have expanded the concept of working-class politics to include issues related to racial, ethnic, and gender oppression and discrimination (see, for example, Collins 1993; Davis 1981). In the United States the impact of these social movements on the social sciences and on politics was profound. It led to a bifurcation in political practice and in scholarship between those who give primacy to working-class politics and class analysis, and those who prioritize identity politics and race, gender, and ethnicity as structures of inequality independent from social class, and as equally determinant of individuals’ life chances as social class. A new social science perspective emerged in the late 1980s: the “race, gender, and class” trilogy, popularized by a journal originally called Race, Sex & Class. This perspective is enshrined in countless articles, anthologies, and books (see, for example, Landry 2007). Within this perspective, the role of class, ostensibly given equal visibility, is often minimized, for class is often reduced to income, and/or to another identity.

Another effect of the bifurcation in politics and scholarship mentioned above is the rise of cultural politics and the rejection of class politics and scholarship as forms of economic determinism or class reductionism. The cul-
turalization of politics can be traced in the new academic and political language: policies about diversity, multiculturalism, identity, inclusion of “diverse” (a euphemism for women and nonwhites) populations in educational institutions and the workplace, the value of “multiculturalism” and “cultural diversity,” and so on have replaced, to a large extent, earlier concerns with the economic, racial, and gender discrimination. This discourse obfuscates the class divisions within the “diverse” populations, and the working-class basis of many of the grievances (for example, low wages, segregated labor markets and employment, exclusion from opportunities for upward mobility and access to higher education, etc.) that fueled the social movements of the late 1960s and early 1970s. The grounds for the emergence of political solidarity across gender and racial/ethnic differences remain as overlooked, in the context of cultural politics, as the poverty, powerlessness, and economic insecurity of white male workers. This is why, in the absence of a discourse on class that could contribute to undermine racial and gender antagonisms, “many Americans have displaced their resentments resulting from what Sennet and Cobb called the ‘hidden injuries’ of class, to patriotism … nationalism … racism and sexism” (Aronowitz 1992, p. 67).

The philosopher Charles Taylor explored the potential conflict between universalizing democratic politics, which equalize all citizens under the law, and the political affirmation of gender, racial, and ethnic differences as sources of dignity and claims for recognition, rather than second-class citizenship. A positive, rather than negative, public evaluation of difference is the objective of what Taylor calls “the politics of recognition” (Taylor 1992). The feminist philosopher Nancy Fraser offers a clear statement of these divisive issues:

Demands for “recognition of difference” fuel struggles of groups mobilized under the banners of nationality, ethnicity, “race,” gender and sexuality … group identity supplants class interest as the chief medium of political mobilization. Cultural domination supplants exploitation as the fundamental injustice. And cultural recognition displaces socioeconomic redistributions as the remedy for injustice and the goal of political struggle. (Fraser 1995, p. 64)

Arguing that justice requires both redistribution and recognition, Fraser identifies important problems inherent in the changes necessary to remedy these injustices, whether such remedies support or challenge the status quo. Measures that seek only to redistribute income to different groups require the preservation of group identities, thus provoking negative reactions from the excluded (for example, whites’ critique of reverse discrimination). Though those groups may strive toward the public affirmation of their identities’ worth and dignity, changes in the allocation of respect will remain superficial, because of the endemic struggles triggered by redistribution. But, transforming identities through deconstruction of the categories currently used to define difference would be just as problematic, for this would deprive groups of the identities that today mechanisms of redistribution and inclusion use to identify those who benefit from such policies (pp. 86–91). Although preserving the cultural and economic status quo is inherently problematic, “… the scenario that best finesse the redistribution-recognition dilemma is socialism in the economy plus deconstruction in the culture,” which “to be psychologically and politically feasible requires that people be weaned from their attachments to current cultural constructions of their interests and identities” (p. 91). In reality, these struggles are intertwined, as the feminist philosopher Iris Young argues in her critique of Fraser’s analysis: economic relations presuppose cultural understandings and cultural and political recognitions are a means toward economic and political justice (Young 1997, p. 148). But these struggles so far appear to be remarkably ineffective in mobilizing the U.S. working class as a class, despite its worsening economic situation. As long as workers tend to perceive themselves primarily in terms of group identities rather than common class location—a situation strengthened by the official political discourse, within which any mention of class and class interests is deemed undesirable, almost “un-American”—perhaps only mass unemployment and household bankruptcies on a scale not seen since the Great Depression might create the material conditions for the emergence of working-class political leaders, simultaneously with the rise in workers’ receptiveness to their views.

Class struggles in Latin America, as in China and Vietnam, have included workers and peasants in political mobilizations under socialist and nationalist banners. For Chairman Mao Tse-tung (1893–1976), national struggles were class struggles; he set in opposition to the ruling classes the mass of “enlightened” workers, farmers, and intellectuals (Mao 1966, p. 10). Some scholars argue, however, that the proletarianization of the middle strata and peasantry has not happened, and that the working class has no privileged role to play. Anticapitalist struggles, in their view, encompass a variety of conflicts between capitalism and sectors of the population inside and outside the working class (for example, conflicts around war and peace, environmental pollution, land management, and so on) (Laclau and Mouffe 1987, pp. 103–104).

Marxist social scientists, however, continue to study the working class and the changes in its size, racial, gender, and occupational composition, giving equal importance to individuals’ relationships to the means of production, skills and credentials, and location in the authority structure (Wright 1997, pp. 17–26). Examining
the transformation of the U.S. class structure between 1960 and 1990, Wright concludes that there has been a decline in the proportion of skilled workers (from 13.46% of the labor force in 1960 to 12.77% in 1990) and unskilled workers (from 44.59% to 41.38%). The working class as a whole, skilled and unskilled, declined from 58.05 percent to 54.15 percent (p. 99). In terms of race and gender, “by a large margin, the American working class now predominantly consists of women and racial minorities” (p. 69). Changes in the racial and gender composition of the working class contribute to the persistence of racial/ethnic and gender conflicts within the U.S. working class and the extent to which issues of racial, ethnic and gender oppression are the most salient and important aspect of workers’ consciousness in the United States.

The meaning of the decline in the size of the working class in the United States and other advanced capitalist countries remains an unresolved and unsolvable issue in Marxist theory. For some (for example, Gorz 1980; Laclau and Mouffe 1987) it signals a reversal of the proletarianization process and an end to the revolutionary role of the working class. Others, however, point out that the proletarianization process worldwide proceeds unabated, and that as the size of the working class declines in the wealthy countries, proletarianization is intensifying in the rest of the world (Arrighi 1990; Wright 1997, pp. 109–110). Another issue subject to conflicting interpretations is the rise in the proportion of propertyless but expert, professional salaried workers, placed in "contradictory locations within class relations" (Wright 1997, p. 20). Is this an indicator of the future demise of the working class, the rise of a new class (for example, a “professional managerial class,” according to Ehrenreich and Ehrenreich 1979), or of the rise of a new working class? On the basis of the analysis of the effects of capitalist development upon the characteristics of the labor force that Marx presents in the Grundrisse (Marx [1857–1868] 1953), Nicolaus (1973) reaches this conclusion: The working class fated to lead the revolution is not the impoverished, unskilled, and pauperized working class but the educated, expert, credentialled working class that develops as capitalists develop the forces of production to such an extent that Marx depicts a time in which the development of the forces of production empowers workers, when

the cornerstone of production and wealth is neither the labor which man directly expends, nor the time he spends at work, but rather the appropriation of its own collective productive power. . . . As soon as labor in its direct form has ceased to be the great wellspring of wealth, labor-time ceases and must cease to be its measure. (Marx [1857–1868] 1953 cited in Nicolaus 1973, p. 329)

Perhaps Nicolaus’s inferences are correct, for it is possible today to observe a bifurcation in the development of the working class: on the one hand, growth in the exploited, poor, and relatively powerless proletariat whose labor fuels the industrialization of Asian and Latin American countries while being the source, through migration, of cheap manual labor and services in the wealthy countries; and on the other hand, growth in the numbers of “the well-fed proletarian, scientifically competent, to whom an eight hour day would presumably appear as a waste of time” (Nicolaus 1973, p. 329). These are issues that can be resolved only by the outcome of current and future political struggles, not by theoretical fiat or the exegesis of scholarly texts.

**BIBLIOGRAPHY**

that limits working hours. The concept of “normal hours” or “legal hours” (France) is used to describe the limit beyond which overtime becomes payable. Although this legal, institutional, and focal time sets the basic rules for entrepreneurial activity, it does not provide an accurate indicator for the amount of time effectively supplied by individuals. The pervasiveness of practices such as overtime, part-time, moonlighting, sick leave, and remuneration systems such as piece rates, hourly wages, or monthly salary, all contribute towards extending or shrinking job hours across offices, shops, and manufacturers. If common sense generally recognizes the working day as something typical that can be calculated as the work time accomplished during a twenty-four-hour period or as the total work-time accomplished in one week, statistical analysis prefers instead to draw this measurement over the full cycle of the year to capture the global picture of work effort. Two main variables are generally considered: “average hours of work per person employed,” which describes actual hours in the work-post, whether paid or unpaid; and “market hours,” which describes hours at work, plus paid off-time (e.g., vacations, holidays, sick leave, and maternity leave).

In terms of free workers who receive payment, the peak of human effort seems to have been historically reached by the middle of the nineteenth century, a time when working hours attained an annual level of between 3,150 to 3,650 hours per year (61 to 70 hours per week). Such harsh conditions resulted from a long-term trend to cut leisure time in the form of breaks and holidays, and from a short-term tendency to expand work time in factory and cottage industries. In western Europe and the United States, men, women, and children experienced the repetition of a twelve-, fourteen-, or even sixteen-hour day, six days a week, fifty-two weeks a year. This was also a period of habituation to the economy of time revealed by mechanical clocks, supervisor’s discipline, and fines.

From 1880 onwards, most workers saw the achievement of the ten-hour day, and only a few who worked in the more competitive industries such as textiles, leather, food-processing, paper, chemicals, and energy production exceeded this limit. In spite of these achievements the spark of industrial agitation and strikes continued thereafter ignited by the demand for higher pay and shorter hours, in what came to be known as the “eight-hour day movement.” The bulk of unions and workers’ voluntary associations joined this demand, and both businessmen and governments were preemptively forced to review work schedules.

By 1920 the eight-hour day was recognized by law in the main industrialized countries. Further reductions in work time took the form of reducing the work week from six to five-and-a-half days, and later to five days. After that,
the downward trend continued through small incremental decreases instead of drastic changes. Thanks to the extension of vacations, holidays, sick days, personal leave, and earlier retirement, substantial improvements were added to the standard of living and the leisure time of workers. The decline in labor time became visible not only in the typical working day, but in all aspects of people’s lives.

For much of the 1950s and 1960s, the primary beneficiaries of fewer working hours were the less educated and lower paid workers. Studies regarding American occupations revealed that individuals with a college education worked longer hours than people with a less formal education. To a lesser extent, those with larger incomes followed the same path of an extended working time. Hence, the upper echelons benefited from the productivity gains brought about by the golden age of economic development through increases in money instead of increases in leisure.

According to sociologist Juliet Schor (1991), the trade-off of more money for less leisure time, endemic of senior executives and professionals, soon filtered down to the less well-off segments of society, wedging millions of Americans into a work-and-spend cycle and an unmitting shortage of free time. Schor estimates that between 1969 and 1987, the average employed person was on the job for an additional 163 hours per year, the equivalent of an extra month. The additional month is attributable to both longer weekly schedules and to more weeks at work, revealing an overturn in the process of incremental decreases of the working day. The causes are twofold: On the supply side, people changed the extension of vacations, holidays, sick days, personal leave, and single jobs for more money; on the demand side, enterprises preferred to pay for overtime rather than increase the fringe benefits required by a larger staff. Schor then concludes that individual choices and economic constraints contributed to the contemporary outcome of the overworked American.

Recent studies have confirmed the tendency to augment working hours, even though this is a phenomenon restricted to a particular group of countries, such as the United States, Sweden, and Hungary. The main pattern of industrializing nations still runs in the direction of a shorter working time or through a stabilization of the average hours of work per person employed, which at present is between 1,500 and 2,000 hours per year.

The increased flexibility of working hours established by a number of arrangements has contradictory effects over the length of the working day: On the one hand, it contributes to the extent of full-time employment through overtime, evening, night, and weekend working; on the other hand, it contributes to shorter hours through the growth of part-time employment. While the United States currently matches the first case, the Japanese evolution fits well into the second.

WORKPLACE RELATIONS

In 1957 economist Gary Becker, in his seminal work on workplace discrimination, noted that employees may interact, and hence have professional workplace relations, with their managers and coworkers as well as customers of the firm. Workers and managers at a firm typically interact through institutions designed to assist firms in carrying out their objectives. These institutions govern performance evaluation, compensation, and discipline. The design and functioning of these systems is studied by human resource professionals and management scholars to evaluate a range of questions, including whether diverse workers are treated fairly and if a firm’s compensation practices promote productivity and firm loyalty. In his 2003 work Paul Levy provided a thorough review of this literature. Marketing researchers and practitioners explore the link between customers and representatives of a firm. Their inquiries are aimed at identifying the services customers expect from a firm’s workforce, how they are best provided, and if customers prefer workers based on race, ethnicity, gender, and factors related to workplace efficiency, such as experience. Social scientists following the pioneering 1952 work of the psychologist Kurt Lewin study the nature of associations between persons in small groups to enrich their understanding of how coworkers interact and influence firm performance. This essay provides an overview of this area of inquiry with emphasis placed on the questions being explored and the insights fostered by prior research.
WHY WORK GROUPS

A worker’s productivity, the output he or she generates per unit of time, depends on the skills and knowledge he or she possesses, called human capital, along with the technological resources available at the work site. Human capital can be acquired through additional schooling, improvements to health, and learning on the job owing to participation in formal job training programs and learning-by-doing through experience. Accumulation of human capital is often a costly and time-consuming process since more highly skilled workers command higher wages, educational materials and instructional time must be paid for, and learning time results in lost production. Nevertheless, firms are willing to finance acquisition of human capital for members of their workforce if the additional knowledge advances worker productivity enough to expand firm profits. However, the breadth of knowledge needed to successfully complete assignments in the workplace has increased since the late twentieth century due to advances in technology and greater globalization along with more complex legal and reporting requirements. Therefore managers have become increasingly uneasy with the prospects that an employee, in isolation, can meet the challenges of the modern workplace.

Managers can organize workers into work groups, also referred to as work teams, that are responsible for completing tasks for the firm rather than assigning duties to an individual. Work groups consist of individuals who are truly interdependent in that they must coordinate their efforts or work together to complete the tasks assigned to the team. Work groups are necessary because of the range of knowledge and talents needed to solve the problems that must be overcome to produce goods and services in a profitable manner. Managers recognize that workers possess different types of skills, talents, backgrounds, and experiences; that they are heterogeneous. The fundamental idea promoting the organization of workers into work groups is that employees with complementary skills can be clustered to enhance the productivity of the firm’s workforce if they are willing to readily share skills and expertise. Thus the breadth of talents needed to complete work does not need to be embedded in a single worker but can be obtained across the members of a work group. A product development work team might be composed of researchers, market analysts, accountants, sales personnel, legal counsel, secretaries, and communications specialists. However, worker heterogeneity may present obstacles to effective work group functioning.

WORK GROUP DIVERSITY AND COWORKER RELATIONS

Managers often construct diverse work groups by selecting members with different demographic characteristics, including race, ethnicity, and gender. They believe that diverse groups will promote better work team performance by incorporating a wider range of ideas and perspectives into the decision-making process. However, when group members are dissimilar, conflicts among them are more likely to arise, weakening group cohesion, which harms skill sharing and productivity (see Patrick L. Mason’s 1995 article for a discussion of the relationship between workplace diversity and discrimination). Social psychologists attribute this to work group members identifying with a subgroup of workers who share a particular demographic trait to a greater extent than to the entire work team. Social psychologists have developed a number of theories to explain why persons in a particular demographic group form such strong allegiances and engage in prejudiced behavior toward persons outside of their group. The litany of theories includes social identity theory (Tajfel and Turner 1986), realistic conflict theory (Sherif 1966), and group position theory (Blumer 1958). These theories hold that biased perceptions and poor treatment across groups is motivated by a desire to maintain or improve the standing of the group a person is affiliated with relative to other groups. Two decades of experimental research by psychologists reviewed by Marilynn Brewer and Rupert Brown in 1999 reveals that social identification with a group elicits liking, trust, and cooperation toward members of that group that are not extended to persons outside of their group.

In 1906 the anthropologist William Sumner coined the term in-group to describe a subgroup ascribed high social status in a society. In 1985 the Nobel Prize–winning economist Arthur Lewis asserted that high social status groups often maneuver and shape legal, political, and educational institutions to obtain economic status and privilege. He referred to subgroups with both social and economic power as dominant groups, while subaltern groups are composed of persons lacking economic privilege and social standing. Relations between coworkers associated with dominant and subaltern subgroups can be particularly troublesome for firms seeking to establish harmonious, highly productive work groups since dominant group members may feel little pressure to share skills with members of the subaltern group. Meanwhile members of the subaltern group may be compelled by their weak political and economic position to cooperate extensively with persons in the dominant group. Therefore status and power differentials may set in motion behaviors that foster economic inequality and tense workplace relations.

Gordon W. Allport’s 1954 contact hypothesis theory and Leon Festinger’s 1957 dissonance theory suggest that bringing diverse groups into greater contact with one another can be an effective way to reduce tensions, alter preconceived perceptions, and ultimately improve cross-group sharing, leading to better firm performance. Work
site policies to improve workplace relations between diverse subgroups are likely to be an expanding presence in the United States due to the growing diversity of the labor force.

WORLD BANK, THE
Conceived in 1944 at a meeting of the Allied powers in Bretton Woods, New Hampshire, the World Bank was created as a counterpart to the International Monetary Fund (IMF). Located side-by-side in Washington, D.C., the World Bank was designed to provide development assistance to countries in need, while the IMF was set up to serve as a lender-of-last-resort for countries struggling with balance-of-payment crises. Together, these twin entities have come to symbolize the kinds of post–World War II multilateralism and institution-building known as the Bretton Woods system. Both the World Bank and the IMF are owned and governed by 184 member countries, which make up the client base of each organization.

Formally, the World Bank is run by a board of governors and a board of directors, which jointly represent the views of all the member countries. The founders of the World Bank vested predominant ownership and control in the wealthier countries, as embodied in a weighted voting system that gives more power to those countries that contribute the most financial resources or quota, which is the amount each member pays according to a percentage of its gross national product (GNP). The World Bank is thus clearly divided between those countries that primarily give funds and those that mostly receive them. The formula used to determine country quotas is based on measurements of national income, foreign reserves, and international trade. Some technical changes in the formula have occurred over the years, while the most important revisions have come about as result of fierce political negotiations.

Although the World Bank’s early work centered on the reconstruction of war-torn Europe, over the years it has primarily focused on the welfare of developing countries. At the same time, it has evolved into a far more complex institution. The World Bank has acquired five main affiliates, which now operate under the banner of the World Bank Group: the International Bank for Reconstruction and Development (IBRD); the International Development Association (IDA); the International Finance Corporation (IFC); the Multilateral Investment Guarantee Agency (MIGA); and, the International Centre for Settlement of Investment Disputes (ICSID).

The IBRD focuses on middle-income and creditworthy developing countries, while the IDA targets poverty reduction in the poorest countries in the world economy. For example, the IDA provides interest-free loans and some grants for programs aimed at enabling poor countries to meet the United Nations’ Millennium Development Goals (MDGs), which were adopted in 2000 in an effort to halve world poverty rates by the year 2015. The role of the IFC is to promote sustainable private-sector investment in developing countries, and MIGA’s mission is to promote foreign direct investment (FDI) in developing countries. Finally, ICSID provides facilities for the arbitration of disputes between member countries and investors who qualify as nationals of other member countries. Recourse to ICSID conciliation and arbitration is entirely voluntary.

A common depiction of the World Bank nowadays is that of an international organization that is overstretched and undernourished, and one that faces several conflicting challenges. These include the general decline in resources available for official development assistance, a rapidly expanding development agenda, and increasing competition from private lenders and other bilateral and non-governmental aid agencies. The World Bank has also been subject to mounting criticism from nonstate actors, who are demanding the adoption of new policies that would greatly increase transparency, accountability, and self-
evaluation. Much of this has to do with the marked changes that have occurred in the international political economy since the World Bank's inception more than sixty years ago.

FROM PROJECT LENDING TO STRUCTURAL ADJUSTMENT

Up until the late 1960s, the World Bank was largely committed to project lending, meaning that its loans were used for investment in physical assets and infrastructure. Such projects were concrete, finite, and usually tied to a given sector, such as hydroelectric energy or railroad transport. This all changed when Robert McNamara assumed the World Bank presidency in 1968. McNamara placed poverty alleviation and the development process itself at the top of his agenda. He shifted the World Bank's mission toward country programming and a region-by-region deployment of project work that was no longer tied to just one sector. It was also during this period that conditionality for World Bank lending was tied more closely to a given country's effort to promote the satisfaction of basic needs among the poorest segment of the population. One of McNamara's strongest legacies was a massive allocation of in-house financial support for development research.

By 1973, when he began his second term as president, McNamara had linked growth with poverty reduction and strongly supported a shift from project lending to loans that would enable the developing countries to undertake structural adjustment programs geared toward policy reform and export promotion. These structural adjustment loans (SALs) would offer incentives for reform progress, as well as disincentives for reformers that lagged. The coinciding of the SALs and the 1973 oil price shocks would delay their widespread implementation until the 1980s, however, because the oil shocks generated excess international liquidity and low-cost private lending alternatives for many developing countries. As a result of these alternative lending sources, the World Bank's client countries were less receptive to the policy coaching and reform guidance that were a condition for disbursement of the SALs. McNamara served as president of the World Bank until 1981.

The advent of the 1982 debt crisis revealed the excesses of the previous decade's borrowing spree, as well as the inability of the World Bank and the IMF to motivate debt-burdened developing countries to sustain the kinds of macroeconomic policy reforms that had been built into the SALs. With the end of the cold war in the late 1980s, and after a full decade lost to policy mismanagement and false starts on the reform front in Africa and Latin America, SALs became most important for these regions. The World Bank embraced a new wave of neo-classical economic orthodoxy and openly promoted the virtues of liberalization.

The 1989 Baker Plan for developing-country debt restructuring signaled another shift in which the World Bank would play a major role. The idea, which met with debatable success, was to use multilateral lending to encourage private international banks to offer fresh loans to those highly indebted middle-income countries that were prepared to undertake further policy reforms. This period also saw the expansion of the World Bank's mandate to include new issue areas like environmental protection, women and development, private-sector reform, and deeper involvement in social service delivery. In 1990 the World Bank's annual World Development Report focused on poverty reduction, reviving earlier commitments that had surfaced during the McNamara era.

THE GLASS IS STILL HALF EMPTY

On December 31, 1991, then World Bank president Lewis Preston inserted the following reminder into each staff member’s Operational Manual: “Sustainable poverty reduction is the Bank’s overarching objective.” This became a main benchmark by which the World Bank was judged as it approached its fiftieth anniversary in 1994. For many critics, the World Bank’s shortcomings on this count were more notable than its achievements. “Fifty years is enough” became one of the retorting slogans from within a tightly knit community of global nongovernmental organizations (NGOs) that had been monitoring the World Bank’s track record. Even a former career economist at the World Bank, William Easterly, would go on to publish a highly critical best-selling book, The Elusive Quest for Growth (2002), a patently blunt analysis of the weak link between World Bank lending and positive developmental outcomes in client countries over the lifetime of the bank.

Apart from its lackluster record on sustainable poverty reduction, the World Bank's branching out into other issue areas has run up against measurement and financing constraints. On the question of measurement, with each passing decade it has become more difficult to firmly assess and hold the institution accountable for the multiplicity of goals that have been pursued. The need to prioritize policy preferences and establish reliable evaluation indicators is one part of this problem; the other lies on the side on internal leadership. Rather than directly tackle those institutional weaknesses that have long been identified as impeding the World Bank's performance, Paul Wolfowitz, who was appointed World Bank president in 2005, has narrowly focused on the elimination of corruption within client borrowers. In the meantime, although the 2015 deadline for reaching the Millennium Development Goals is rapidly approaching, the World
Bank risks lagging further behind in its ability to play a key poverty reduction role.

On the question of financing, the World Bank faces two main constraints. First, there is a growing divergence between voting rights and the contributions made to IBRD equity by shareholders, as the share of retained earnings has risen while the share of paid-in capital has declined over the years. In short, the major shareholders have used their control rights to allocate portions of IBRD net income in ways that serve their interests over those of the institution as a whole. Second, the continuation of a stagnating loan portfolio in nominal terms, and a declining one in inflation-adjusted terms, is likely to curtail the bank's net income from lending operations and make its profitability increasingly dependent on financial trading. Part of this is a generational shift, whereby the dependence of middle-income countries on official assistance has greatly declined, leaving the IBRD with a dwindling client base. An obvious but highly controversial solution would be to shift these funds to the IDA, where the borrowing demands from poorer country members are still on the rise. While the IBRD is still the most important institution of the World Bank Group, and while it is obviously reluctant to cede financial power, the IDA is gaining ground in a de facto manner.

In sum, since the 1980s, the work of the World Bank has mainly affected the poorer developing countries, yet the structure of representation on the board of directors has changed little since it was established at Bretton Woods in 1944. This imbalance raises crucial stakeholder issues, for the World Bank's own research suggests that policy reform commitments will be upheld when governments actively participate in the identification and formulation of these very programs. On these grounds alone, the argument favoring internal reform of the World Bank's governance structure is a compelling one.

**DEVELOPMENT AGENCY VERSUS DEVELOPMENT BANK**

For all its shortcomings, it is important to note that the World Bank has successfully changed its profile from that of a development bank proper to the world's leading development agency. This partly reflects the long-term payoff from the financing of development research. Indeed, the World Bank has become one of the most important sources of knowledge for development and poverty reduction. The influence of the policy research generated in-house by the World Bank is overwhelming, both in terms of quality and quantity. Lending and operations, loan proposals, and assessment of the outcomes are still an important part of the bank's daily workload, but it also undertakes research in over 150 countries and brings together the world's largest concentration of development specialists.

A key criticism nowadays is that the legitimacy and credibility of the World Bank's expertise is drawn through a circular process between the knowledge it produces and the audiences that legitimize this knowledge. The World Bank Institute (WBI), created in 1955 to train policymakers in development economics, has become increasingly influential. In 1999 the WBI created the Global Development Network (GDN) with the aim of building research capacities in the Global South. But the GDN's doubts point to its rationalist tendency, which portrays research as scientific and independent from its social context. This is captured by the GDN slogan: “Better Research, Better Policy, Better World.” However, neither its ideas nor its research are neutral. Partnerships with the South have enabled the World Bank to pair up with institutions that share its core ideas while arguably excluding other viewpoints. At a time when critics are calling for a more open and inclusive debate about development strategy, the World Bank seems increasingly resistant to an open exchange of this nature.

**WORLD HEALTH ORGANIZATION**

The World Health Organization (WHO) was established in 1948 when its constitution entered into force. WHO
was created to be the United Nations’ specialized agency for health. The WHO’s mission is “the attainment by all peoples of the highest possible level of health” (WHO Constitution, Article 1).

International health cooperation began in the mid-nineteenth century, and the need for an international health organization was discussed in the latter half of that century. The first half of the twentieth century witnessed the creation of various types of health organizations, both regional (e.g., Pan American Sanitary Bureau, 1902) and international (e.g., Office International de l’Hygiène Publique, 1907; Health Organization of the League of Nations, 1923). WHO’s establishment consolidated international health activities in one organization, membership in which was open to all states. In 2005, 192 states were WHO members.

The WHO Constitution’s preamble defines health as the “state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity.” This definition empowers WHO to work on virtually all aspects of communicable and noncommunicable diseases. The WHO Constitution also stipulates that the enjoyment of the highest attainable standard of health is a fundamental human right, and the concept of a “right to health” has helped shape WHO policies.

WHO has three governing organs—the World Health Assembly (WHA), Executive Board (EB), and Secretariat. The WHA is the supreme policy-making body and is made up of representatives from all WHO member states. It meets annually to establish policy for the organization and to make other decisions important to WHO’s operations, such as approving the budget. The EB acts as the WHA’s executive organ and is comprised of representatives from thirty-two WHO member states who are technically qualified in the health field. The Secretariat, headed by a director general appointed by the WHA, is responsible for the technical and administrative aspects of WHO policy implementation.

WHO’s headquarters are in Geneva, Switzerland, but there are also regional offices in the Americas, Europe, the eastern Mediterranean, Africa, Southeast Asia, and the western Pacific. WHO representatives working at the country level provide support to WHO headquarters and regional offices.

Since its establishment, WHO has focused much of its effort on improving health conditions, systems, and policies in developing countries. WHO efforts in this regard have followed two basic approaches. First, WHO has implemented “vertical” programs targeting specific diseases, such as disease eradication efforts. The second approach involves “horizontal” strategies that seek to improve health-system capacities with respect to multiple threats that populations face. WHO’s efforts to ensure universal access to primary health care services provide an example of a horizontal approach.

WHO achieved some success in both vertical and horizontal strategies during the first few decades of its existence. In the late 1970s WHO completed the worldwide eradication of smallpox, an achievement widely regarded as one of the most important public health successes of the twentieth century. WHO also helped developing countries increase childhood immunization rates. Vertical strategies did not, however, always work. For example, WHO’s campaign to eradicate malaria, initially started in the 1950s, did not succeed.

At approximately the same time that WHO successfully eradicated smallpox, it launched the seminal Health for All by the Year 2000 initiative, a horizontal campaign to provide all people, especially those in developing countries, with access to primary health care services. In addition to advancing the concept of the “right to health,” the Health for All effort increased attention to the social determinants of poor health (e.g., poverty, limited education, and racial and gender inequities), which cannot be managed through medical technologies, such as vaccines, but only through social policies linking health with the pursuit of broader social or distributive justice.

These achievements were followed in the 1980s and 1990s by crises that revealed the weaknesses of and problems in WHO. The 1980s witnessed the explosion of HIV/AIDS into a global health problem, particularly for developing countries and especially sub-Saharan Africa. Responsibility for the global response to HIV/AIDS was eventually taken from WHO’s Global Programme on AIDS in 1996 and assigned to a newly created entity, the Joint United Nations Programme on AIDS (UNAIDS). Nevertheless, HIV/AIDS continued to spread globally and, according to UNAIDS, has become one of the worst pandemics in human history.

In the 1990s WHO struggled with the emergence and reemergence of many new and old communicable diseases, a phenomenon made more challenging by the acceleration of globalization that occurred after the end of the cold war. The 1990s also saw WHO trying to address increased morbidity and mortality in the developing world caused by noncommunicable diseases, especially those related to tobacco consumption. WHO’s responses to these mounting global health threats were undermined by leadership and institutional problems at WHO headquarters and regional offices. The failure of WHO member states to achieve the goals of Health for All by the Year 2000 was painfully apparent as the twentieth century came to a close.

Efforts in the latter half of the 1990s and the early 2000s to renew and reinvigorate WHO and its mission have achieved some success, returning credibility and
influence to the organization. Key achievements include the successful WHO global response to the 2003 outbreak of severe acute respiratory syndrome (SARS); the adoption of the Framework Convention on Tobacco Control in 2003 as part of the global strategy to reduce tobacco-related diseases; and the adoption in 2005 of the new International Health Regulations, which represent a significant development for global health governance and for WHO’s authority and responsibility concerning the international spread of disease. WHO has also been active in addressing the benefits and costs globalization presents to health policy, assessing potential synergies and conflicts between health and international trade law (especially within WHO), working with nongovernmental organizations in health-centered public-private partnerships, advancing health components of the UN’s Millennium Development Goals, and pursuing disease eradication (e.g., Global Polio Eradication Initiative).

WORLD MUSIC

The term “world music” was first circulated in ethnomusicology (the study of music in or as culture) and entered Western popular culture as a category of musical commodity in the 1980s. It is a packaging of music “from the outside” into popular music primarily intended for Western consumers. In this sense, world music generally connotes non-Western music traditions (e.g., singing-storystelling in Mali, qawwali in Pakistan, and Aboriginal music in Australian); music that combines Western and non-Western elements (e.g., Nigerian jùjú and Afrobeat, Paul Simon’s collaborations with South African musicians); and non-mainstream music from folk traditions or ethnic groups within Western societies (e.g., Irish folk music, salsa in New York, Indian bhangra—fusion of folk music with Western popular music—in London). The term is intended to exclude other marketing categories (e.g., classical, rock), but its boundaries have never been clearly delineated, and what is considered world music has changed over time, affected by shifting patterns of Western musical interests.

At least since the 1960s, ethnomusicologists have used the term world music to denote all music (e.g., folk, art, popular) of all the world’s peoples. The “world” qualifier stresses the inclusion of non-Western music. In practice, studies of world music have tended not to include Western art (classical) music, so the term, as used in ethnomusicology, tends to refer more to music outside of that tradition.

Music scholar Timothy D. Taylor recounts the entry of world music into popular discourse in Global Pop: World Music, World Markets (1997). In response to growing sales of non-Western music recordings, representatives of independent record companies, broadcasters and concert promoters met in London in 1987 to discuss marketing the music. They determined that record stores were reluctant to stock the music because it was not clear under which heading it should be sold: The existing rubrics of folk, ethnic and international were not clearly defined, differentiated or adequately promoted. Following ethnomusicologists, the group decided to term the emerging niche world music. The term entered the music press and spread internationally. In 1990 Billboard magazine created a world music chart, and in the 1990s catalogues and guidebooks to world music appeared, such as World Music: The Rough Guide.

Whereas ethnomusicologists introduced the term world music as an inclusive term, in music promotion and distribution the term is used to distinguish it from other existing categories such as pop, rock, classical, and jazz. Yet the precise boundaries of the world music category are unclear and somewhat fluid, as the following examples illustrates. Filipina singer Banig sings in a Western pop
style with English lyrics, and as Timothy Taylor observes in *Global Pop*, she is classified as a world music artist. Swedish band Ace of Base, French Canadian Céline Dion, and German singer Nena are all categorized as pop music rather than world music, regardless of which language they use. World music is sometimes defined as “roots music,” meaning that it is perceived as explicitly connecting with or continuing a people’s tradition or heritage. Thus, while Nena and the German band Kraftwerk are not classified as world music, German Heimatmusik (music associated with the countryside) is categorized as world music. In addition, the content of world music racks in stores is shaped more by trends in Western music purchasing than a systematic attempt to represent all the world’s music. The swaying of the Celtic music subcategory within world music in the 1990s was due to North Americans exploring their (vaguely defined) Celtic heritage and not, for example, a change in the overall makeup of the music of the world.

THE POPULARITY OF WORLD MUSIC IN WESTERN CULTURES

There has been Western interest in world music as far back as Westerners have encountered other cultures. For example, the Middle Eastern santur was a blueprint for the European pianoforte, and the banjo was descended from a Northwest African lute adapted by Africans in the Caribbean. During the twentieth century there was an acceleration of outside influences on music. Examples include the “Latin invasion” of the 1930s and 1940s (audible in the music of Duke Ellington and Dizzy Gillespie); the popularity of calypso in the 1940s and 1950s (the Andrew Sisters and Harry Belafonte); Brazilian *bossa nova* in the 1950s; and South African vocal music in the 1960s (*The Tokens’s “The Lion Sleeps Tonight”).

During the 1960s and 1970s there was a surge in popularity of folk and folk-rock music, stimulating an unprecedented interest in world folk music recordings. Folkways Records and Elektra Record’s Nonesuch Explorer Series began to meet this growing demand. Several British and American popular musicians incorporated world musical elements into their music, for example, George Harrison (Indian *sitar* and *ragas*), Led Zeppelin (Arabic melodies) and the Clash (reggae rhythm).

George Harrison, and Paul Simon later (with *Graceland*), not only incorporated world influences, but “curated” the music like ethnomusicologists. The musicians went into the field (Harrison to India, Simon to Africa), “discovered” the music, and presented it to the Europe and North American market, often performing with world musicians. World music was introduced to listeners by familiar musical personalities with star appeal. David Byrne, Peter Gabriel, and Mickey Hart followed in this vein. Ethnomusicologist Steven Feld argues that the Western experience of world music in the 1980s was largely shaped by “pop star collaboration and curation” (Feld 2000, p. 149). As world music grew in popularity, an increasing number of record labels started marketing it.

Pop-star collaboration and curation continued into the 1990s; however, other channels of distribution also emerged. In the late 1990s and 2000s the Internet became a leading means of distributing world music. With the Internet, the term world music is perhaps less crucial to marketing because consumers can also search online by country of origin, musician, or instrument. But the category shows no signs of disappearing. The world music category is prominently used in Web sites and sold in the cosmopolitan cities of Europe, North America, Australia, and elsewhere. Also, chain coffee shops increasingly sell recordings of world music, such as the Hear Music CDs in Starbucks.

WORLD TRADE ORGANIZATION

The World Trade Organization (WTO) is the international organization that oversees trade among member nations and acts as a forum for governments to negotiate trade agreements and settle trade disputes under a system of rules and procedures. Its aim is to increase world trade by lowering barriers to the international sale of goods and services, including intellectual property. The WTO was formed on January 1, 1995, replacing the postwar multilateral trading order under the General Agreement on Tariffs and Trade (GATT) with a more formal institutional arrangement. Headquartered in Geneva, Switzerland, the WTO as of November 2006 had 150 members, the latest addition being Vietnam. As of this date Russia was the largest state that was not yet a member. The governing principles of the WTO's global trading system were described by Director General Pascal Lamy in 2006: “Built up stone by stone over the past 50 years, this system is founded on the idea that prosperity depends on efficiency, stability, predictability, and equity in international trade” (Lamy 2006).

THE SUCCESSOR TO THE GATT

In some respects, the WTO is a new organization, growing out of globalization, but the idea of an international trade institution dates at least to the period immediately following World War II (1939–1945). The Bretton Woods Conference of 1944, near the end of World War II, proposed the creation of an International Trade Organization to complement the International Monetary Fund and Bank for Reconstruction and Development (World Bank) in order to stabilize the postwar world economy and promote trade. The member states of the United Nations (UN) agreed to the creation of the International Trade Organization (ITO) at the UN Conference on Trade and Employment in Havana, Cuba, in 1948. The ITO charter covered trade in goods and services and included rules on employment, commodity agreements, restrictive business practices, and investment. The organization failed to materialize, however, when the U.S. Senate rejected the implementing agreement.

GATT, a part of the proposed ITO, survived as a treaty agreement among twenty-three of the fifty signatory states of the ITO to set tariffs (or customs duties) to mutually agreed-upon levels without discrimination among members under a generalized system of preferences. This system called for treating goods from all countries on the same level as that of the most-favored nation (MFN) and allotted national treatment to both domestic and imported goods once they had entered the market. Certain exceptions to the nondiscrimination principle were allowed—for example, for regional trading arrangements or special access to developing countries—because these types of arrangements expanded regional trade and accorded with the goal of expanding global trade. These principles and exceptions were incorporated into the WTO. Tariff levels were agreed on through an intergovernmental negotiating forum facilitated by the small GATT secretariat, but the system did not provide for any enforcement mechanisms or dispute-settlement procedures, and it dealt almost entirely in trade in goods. Services and intellectual property were later addressed under separate agreements—the General Agreement on Trade in Services (GATS) and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS)—that were also incorporated into the WTO. GATT also contained provisions against unfair competitive practices, such as dumping and subsidies, that are also part of WTO fair-trade rules.

Two major industries were given special treatment under the postwar system—agriculture, which was not covered by GATT, and textiles and apparel, which was regulated under a quota system set up by a separate multilateral agreement, the Multifiber Agreement, until 2005. Eight rounds of multyear trade negotiations were completed under GATT. The WTO was created at the conclusion of the eighth round, known as the Uruguay Round (1986–1995).

INSTITUTIONAL FRAMEWORK AND DISPUTE-RESOLUTION MECHANISMS

Unlike GATT, the WTO has an extensive institutional structure. It comprises the Ministerial Conference, the General Council, and a Secretariat with various bodies, committees, divisions, and working groups on specific issues. The General Council is the WTO’s highest decision-making body and meets on a regular basis. Its members are official government representatives, the ambassadors to the WTO, from all member states. The Ministerial Conference comprises the trade or commerce ministers of the member states and meets approximately every two years; the Sixth WTO Ministerial Conference met in Hong Kong, China, on December 13–18, 2005. The Ministerial Conference issues declarations and decisions outlining the broad mandate of the WTO. A recurrent desire expressed in these declarations has been for greater cooperation and coherence between the IMF, World Bank, and WTO on global economic policy making and development.

The structure of the WTO was created by the legal texts of the Uruguay Round of trade negotiations, which include approximately sixty agreements, annexes, decisions, and understandings incorporating GATT, GATS, and TRIPS and covering trade in goods, services, intellec-
tual property, dispute settlement, and transparency through reviews of governments’ trade policies. The agreements negotiated under GATT and the WTO provide the legal ground rules for international commerce, binding governments much like commercial contracts. Like any contract, disputes between parties are likely to arise, and for this reason a new dispute-settlement process was written into the WTO agreements and have become a central pillar of the global trading system. Within this system, a member country can file a dispute against another country or group of countries that it believes is violating a rule of the agreements or failing to live up to its obligations under the agreements.

The procedure resembles a court or tribunal, with formal consultations, mediation, and a panel set up to hear the arguments, examine the legal obligations of the parties, and prepare a report for the Dispute Settlement Body (consisting of all WTO members) to adopt or reject. It also includes an appeals process based on legal interpretation heard by a permanent Appellate Body composed of seven individuals of high legal standing without governmental affiliations. Members of the Appellate Body have four-year terms and can uphold, modify, or reverse the panel’s legal findings or conclusions. Rulings are adopted by the Dispute Settlement Body automatically unless there is a consensus against the panel or appeals report (not a consensus in favor of the report) and are binding; if a state loses a dispute, it must comply with the report recommendations and state its intention to do so within thirty days. In cases of nonimplementation, the parties negotiate compensation pending full implementation. The Dispute Settlement Body monitors implementation of the report rulings and recommendations (if adopted) and has the power to authorize retaliatory action by the harmed country against the country violating its treaty obligations. By July 2005 a total of 332 cases had been brought before the WTO. A typical dispute may take up to sixty days for consultations, up to a year for panel review without an appeal, or a year and three months with an appeal. For any given dispute, the panel’s report is normally presented to the parties within six months (or three months when the issue involves perishable goods).

THE DOHA ROUND

Trade negotiations among member states continue under the WTO, as under GATT, on a multyear, multilateral basis. As of May 2007 the ninth round of global trade negotiations, the Doha Round, was still ongoing. Doha Round negotiations began in 2001 and are considered by many as much more difficult than earlier rounds. Several reasons are commonly used to explain this difficulty: (1) It goes deeper and farther than other rounds in addressing for the first time such issues as agricultural subsidies and bureaucratic border requirements and documentation, making for political complexity. (2) It makes greater attempts at fair trade by making economic development more central to the international trading system. (3) The membership has grown so much in size and socioeconomic diversity that negotiating outcomes based on the practice of consensus has become much more difficult. (4) It faces strong opposition to globalization by various nonprofit associations representing labor, the environment, and other constituencies. The WTO has been a focus of globalization debates among intellectuals and policy makers and a target of antiglobalization protests by civil society groups.

CONTROVERSY AND 1999 SEATTLE PROTESTS

The WTO has come to represent the institutionalization of globalization, with its positive trade expansion effects as well as its negative effects on communities, local industry, and human rights. The adverse effects of globalization have given rise to a global social movement with active published criticism and consistent protests by activists at WTO Ministerial meetings as well as the annual World Bank–IMF conferences. The first protest of significant size and impact took place at the WTO Ministerial meeting in Seattle from November 29, 1999, to December 3, 1999. An estimated 50,000 protesters from around the world included human rights groups, students, environmental groups, religious leaders, labor-rights activists, others demanding fair trade with less exploitation, and various protectionist groups demanding a nationalist response to maintain domestic industries and preserve communities without foreign influence. While the majority were nonviolent protestors, a small group clashed violently with police, leading the Seattle police and the National Guard to declare a state of emergency that included curfews, arrests, teargas, pepper spray, and rubber bullets fired at nonviolent protestors. Many found the violation of the right of free speech for the purpose of free trade and the ensuing police actions unacceptable. Enormous public protests ensued, ultimately causing the resignation of the Seattle police chief and succeeding in disrupting the meeting, which collapsed. Over 500 related events took place between February 18, 1999, the day the Ministerial location in Seattle was announced, and mid-December 1999, after the WTO had departed. Over 1,400 organizations signed a letter stating their opposition to the WTO. According to the text of the letter, protesting organizations accused the WTO of

principally to pry open markets for the benefit of transnational corporations at the expense of national and local economies; workers, farmers, indigenous peoples, women and other social...
At the root of the protests are many fundamental differences in the perspectives of developing and industrialized nations, as well as labor unions and some domestic industry in developed countries, on the current reality of free trade and how it affects them. The protests have drawn attention to the democratic deficit within the WTO and to the social issues globalization can adversely impact. However, long-term legislative impact on the WTO itself remains unclear.

WORLD WAR I

World War I (1914–1918), known as “The Great War” at the time, marked a profound political, economic, and social shift in international relations. Historian Eric Hobsbawm has referred to 1914 as the de facto beginning of the twentieth century.

The triggering cause of the war was the assassination of Archduke Franz Ferdinand, the Habsburg heir, on June 28, 1914, in Sarajevo by Bosnian Serb nationalists. This matter might have stayed an internal dispute in Austria-Hungary, but other states quickly took sides. Germany, the Ottoman Empire, and Austria-Hungary made up the Central Powers. Russia stood up for the Serbs, and was joined by France and Great Britain in the Triple Entente.

According to one interpretation of World War I, a rigid alliance structure drew reluctant states into what would otherwise have been a localized conflict. Many of the belligerents did have alliances binding them to a particular side. For example, both Britain and France had pledged to defend Belgian neutrality, which was violated at the beginning of the war by German invasion. However, all of the belligerents also had compelling national interests for participating in World War I, including concerns about national insurgency and perceptions of the European balance of power.

Nationalism drew belligerents into World War I in two ways. Russia defended Serbia at least partly in the name of pan-Slavism, or solidarity among Slavic peoples. The Ottoman Empire had a different concern. Like its Habsburg counterpart, the Ottoman Empire comprised a variety of national groups, all ruled by a single dominant national group. The spread of democracy and other egalitarian movements in Europe challenged the legitimacy of the old empires. Over the course of the nineteenth century, the Ottoman Empire experienced various national uprisings, including those by Greeks, Serbs, Bulgarians, and Armenians. By helping the Habsburgs resist nationalist insurgency, the Ottomans hoped to avert future problems of their own.

In addition, many states were concerned about the changing European balance of power. The pentagonal balance created at the 1815 Congress of Vienna had been relatively successful, both in keeping European conflicts manageable and protecting the interests of Austria-Hungary, Britain, France, Germany (previously called Prussia), and Russia. By 1914, however, several of these states were not content with the existing balance of power.

For example, Germany was a latecomer to imperialism, a process dominated by France and Britain, and therefore perceived itself at a disadvantage in both power projection and resource extraction. Although overseas imperialism offered limited possibilities by the early 1900s, Germany began to pursue a policy (Drang nach Osten) of increased economic and political influence in eastern Europe, thus “colonizing” the region. German leaders argued that this would balance French and British power.
France and Britain, however, did not perceive themselves as at an advantage vis-à-vis Germany. Germany had benefited tremendously from the Industrial Revolution, especially since its natural resource base was well suited to industrial production. In 1870, Germany ranked third in industrial production behind Britain and France. By 1914, Germany led them both by a substantial margin. Britain and France feared that Germany's economic trajectory would soon render most efforts at power balancing. To avoid German hegemony as a fait accompli, the other great powers would need to act quickly.

Russia, too, had balance-of-power concerns regarding Germany, with which it shared a tense history. The Drang nach Osten interfered with Russia's domestic economy and trade with its neighbors. Furthermore, Russia had been at an enduring geopolitical disadvantage because it lacked warm water ports (i.e., ones in which the water does not freeze), which limited its military and commercial expansion. Defeating the Central Powers could mean Russian access to Germany's Baltic ports and the Mediterranean Sea via Turkish straits.

THE WORLD AT WAR

Once the war began, its course was horrifyingly unique to European experience. Germany expanded the aggression outside of Austria-Hungary by implementing the Schlieffen Plan, a military strategy designed to prevent Germany from fighting on two fronts simultaneously. The existence of such a plan reflected the influence of prevailing social attitudes on military doctrine. The popularity of ideas such as Social Darwinism, a perversion of Charles Darwin's concept of natural selection then applied to human social interaction, bred a pan-European "cult of the offensive," or fanatical confidence in initial aggression as the guarantor of victory. Darwin argued that organisms with traits well suited to their environment would be the most likely to survive and reproduce. The Social Darwinist ideal twisted this commentary to argue that powerful groups had the ability, even the right, to dominate weaker ones and to mold human relations as they saw fit. As a result, states generated extremely aggressive military grand strategies—their overall plans for using the military instrument of foreign policy. For example, Germany's Schlieffen Plan called for the speedy conquest of France, via neutral Belgium, so German forces could then focus on an eastern front against Russia, which would mobilize relatively slowly for geographic and technological reasons.

The reality of World War I looked very little like the Schlieffen Plan. In early August 1914, Germany attacked Belgium. Reinforced by troops from Britain and France, Belgium tenaciously resisted German invasion. Russia, having anticipated conflict with Germany and availing itself of technological advances such as railroads, mobilized faster than Germany had anticipated. Within weeks, Germany found itself caught in a two-front war.

This conflict was unlike any Europe had seen before. A popular slogan claimed that soldiers marching off in August 1914 would be "home before the leaves fall from the trees," but even after months the two sides had made little progress toward their war aims. Various conditions of the war made territorial conquest difficult. In the west, the extremely flat terrain of Southwestern Belgium provided little natural shelter. This encouraged trench warfare, the digging of passageways open to the surface, from which soldiers could attack with at least minimal cover. The introduction of barbed wire assisted in this process and in holding territory. Capturing territory from the trenches was difficult. Instead, World War I became a war of attrition, in which victory would be defined by exhausting the enemy's resources rather than by superior mobility and territorial conquest. Military engagement frequently ended in deadlock, as when the 1916 German attack at Verdun preempted an Entente offensive on the Somme, but did not achieve the larger goal of crippling the French. Later that year, Britain launched its first major offensive of the war, at the Somme. In four months the Entente lost some 600,000 men while gaining only a few miles of territory. For years, neither side had an enduring battlefield advantage, although both expended unprecedented amounts of materiel and human lives. At least twenty million soldiers were killed or wounded during the war.

Military leaders introduced destructive new technologies, attempting to break the trench stalemate. Machine guns allowed for tremendous firepower and resulted in devastating casualties, as did tanks and submarines as new weapons platforms. Poison gas, introduced by Germany at Ypres in 1915, was difficult to control in deployment and undetectable until its effects were irreversible; gas caused pain, burns, other physical trauma, and death. These conditions eventually generated a sense of futility and ennui among many soldiers, and caused mutiny late in the war, such as that of the French army in 1917. One of the lasting consequences of these battle conditions was the emergence of "shell shock" (today known as post-traumatic stress disorder), which disabled thousands of soldiers who had survived the fighting.

On the eastern front, armies enjoyed greater mobility but suffered staggering casualties in the face of the technological innovations. In 1917 Russia withdrew from the conflict because of the Bolshevik Revolution. Britain and France appealed to the United States, which had been supplying their war effort for some time, to take Russia's place. Although President Woodrow Wilson (1856–1924) had campaigned on a no-war platform, the economic significance, in particular of Britain and France, finally persuaded him to change his position. With the declaration
of war by the U.S. Congress on April 6, 1917, the United States formally allied itself with Britain and France.

The new influx of American resources and personnel, beginning in earnest in the summer of 1918, was too much for Germany. Recognizing that Germany could not win a war of attrition against this energetic, well-supplied new enemy, the German navy mutinied, popular revolution led the Kaiser to abdicate, and the new government agreed to an armistice on the Entente’s terms. The agreement was signed on November 11, 1918, at 11:00 a.m. For many Germans, the Entente victory seemed illegitimate. Germany had not been outmaneuvered on the battlefield and victorious Entente troops did not capture Berlin. Rather, the Entente seemed to have won by calling in outsiders to the dispute; this said nothing about Germany’s prowess vis-à-vis France and Britain.

Beginning in January 1919, the former belligerents met in Paris to formulate the peace treaty, known as the Treaty of Versailles after the palace in which it was signed. President Wilson attended the conference, to the surprise and consternation of many of his counterparts, making him the first sitting U.S. president to visit a foreign country. Two major goals of the treaty were to render Germany harmless and to avoid future problems with national insurgency. To achieve the first goal the victors implemented a number of programs targeting Germany, including reparation payments, disarmament, and neutralization of territory. To achieve the second goal, the victors promoted national self-determination for European ethnic groups, redrawing the map of eastern Europe so that the political boundaries more closely matched the homelands of ethnic groups.

WORLD WAR II

World War II was a military conflict from 1939 to 1945 that engulfed much of the globe. It is considered to have been the largest and deadliest war in world history, killing 62 million people on the battlefield, in massive bombings of civilians in cities, and by genocide. There were two hostile camps—the Axis Powers of Germany, Italy, Japan, Romania, Bulgaria, Hungary, Croatia, Slovakia, Finland (cobelligerent), Thailand, and others; and the Allied Powers of the British Empire and Commonwealth (including India, Canada, Australia and New Zealand), France, the United States, the Soviet Union, China, the Netherlands, Norway, Belgium, Poland, and others. The global reach of the empires of France, Italy, and Britain meant that non-European areas became directly involved with battles fought in Africa, the Middle East, Europe, and Asia. Organized civilian resistance movements in occupied countries (notably Yugoslavia, France, and Greece) made important contributions to the Allied war effort. The economic effects of the war have been estimated at $1 trillion in 1945 (approximately $10.5 trillion in 2005 terms). It is the only time in history that nuclear weapons were used (by the United States against Japan). The end of World War II resulted in the partitioning of Europe into East (ruled by Communist governments under the sphere of influence of the Soviet Union aligned under the Council for Mutual Economic Assistance, or Comecon, and the Warsaw Pact) and West (with democratic governments receiving economic reconstruction aid through the U.S. Marshall Plan aligned under NATO), the U.S. occupation of Japan, and new international organizations such as the United Nations, the International Monetary Fund, and the World Bank. The immediate postwar era also saw the rise of European integration efforts with the formation of the European Coal and Steel Community and the European Economic Community, which would develop into the European Union by the end of the century, and the beginning of the cold war between the United States and the Soviet Union that would mark the second half of the twentieth century.

Expansionism and Economic Conditions

Territorial expansion of Germany and Italy began before any military hostilities. The most noted example of territorial demands made by Hitler’s Germany is Czechoslovakia (where Germans comprised one-third of the population), followed by German-speaking Austria. But the Reich sought further expansion. Many in Germany never accepted the creation of Poland following World War I, and they focused territorial demands on the Polish Corridor, a narrow strip of land separating East Prussia from Germany that allowed Poland access to the Baltic
Sea, but also sought broader territory that would expand Germany to a common border with Russia. In 1935 Germany regained the Saar region, in March 1936 it reoccupied the Rhineland, and in 1937 it achieved Anschluss (union) with Austria. Italy’s fascist leader, Benito Mussolini, also hoped to acquire territory, particularly at the expense of France, Albania, and Greece, to create a New Roman Empire. In 1934 Italy moved against Abyssinia on the border of Italian Somaliland and Ethiopia. Territory was also an important factor in the war in Asia. One of the most often cited reasons for Japan’s aggression in Asia is that nation’s need for the raw materials naturally lacking in its own territory. Thus Japan, the only burgeoning industrial economy in Asia at the time, invaded first Manchuria, then other areas throughout the Asian mainland, and finally the Western Pacific in order to secure necessary natural resources such as oil and iron ore.

The economic effects of the Treaty of Versailles and the Great Depression were important factors in radicalizing German politics. In April 1921 Germany was presented with a reparations bill of $33 billion by the victorious allies of World War I. Reparations payments hobbled the weakened German economy, causing rapidly rising inflation and a dramatically depreciating currency. France refused Germany’s request for a postponement, Germany defaulted on the war reparations in 1923, and the French army occupied part of the Ruhr (the German industrial zone). Hyperinflation ensued as the German currency, the mark, plummeted to 4 billion marks to the dollar (from 75 marks to the dollar in 1921 and 18,000 in January 1923), eliminating life savings and making salaries worthless. Groceries cost billions of marks (wheelbarrows of currency were needed for a single loaf of bread) and hunger riots broke out. In September 1923 the German government resumed reparations payments, inciting bitter popular resentment and paving the way for extremist political groups such as the Nazi Party (National Socialist Party).

IDEOLOGY, NATIONALISM, AND MILITARISM
Under the terms of the Treaty of Versailles, the German army was allowed to remain intact and was not forced to admit defeat by surrendering. The German general staff supported the idea that the army had not been defeated on the battlefield and could have fought on to victory were they not betrayed at home (the Dolchstoßlegende, or “stab-in-the-back legend”) by German politicians who signed the November 1918 armistice (the “November Criminals”). The theory became very popular among Germans: Adolf Hitler, a World War I veteran, became obsessed with this idea, laying blame firmly on Jews and Marxists for undermining Germany’s war effort. The Nazi Party won 230 of 608 seats in the Reichstag (German parliament) in January 1933; within six months Hitler was elected chancellor. The Nazis pledged to first restore Germany to its rightful place in Europe, and then to seek world power.

Racism and anti-Semitism characterized the Nazi Party, which organized official boycotts of Jewish shops and professional men and the opening of the first concentration camp in Dachau, outside Munich, in March 1933. In September 1935 the Nuremberg Laws relegated Jews to separate, second-class status and prohibited intermarriage and sexual relations with Aryan Germans. In November 1938 Nazis orchestrated a nationwide pogrom on Jews following the murder of a German diplomatic assistant in the German embassy in Paris by a French Jew. Jewish homes, shops, and 191 synagogues were destroyed and 20,000 Jews were arrested on Kristallnacht (“Night of Broken Glass”). German anti-Semitism culminated in the Holocaust.

Although technically an absolute monarchy under Emperor Hirohito, Japan was politically dominated by a group of militaristic generals in charge of the most powerful army in Asia at the time. Japanese militarism was accompanied by racism, toward both Europeans and other Asians, especially Chinese and Koreans. Anyone who was not Japanese was considered inferior and treated as such. One example of Japanese violent racism is General Shiro Ishii’s Unit 731 experiments in Pingfan in Harbin, China, in which as many as 10,000 Chinese, Korean, and Russian prisoners of war and civilians were subjected to brutal experiments in vivisection, germ warfare, and weapons testing.

APPEASEMENT
Britain and France followed an early policy of accommodation and compromise in Germany’s favor in the hope of avoiding another war, known as the “policy of appeasement”; many thought the Treaty of Versailles imposed unreasonable demands on Germany. In June 1935 the Anglo-German Naval Agreement was signed, signaling Britain’s unwillingness to defend the Versailles settlement. In March 1936 German military reoccupation of the Rhineland (demilitarized under the Versailles Treaty) met with no opposition from France and thus successfully challenged France’s willingness to defend the Versailles settlement. In January 1937 Hitler publicly broke with the Treaty of Versailles.

Neville Chamberlain, the prime minister of Britain from 1937 to 1940, is known for adopting a policy of appeasement in an attempt to preserve the peace and buy time for any major rearmament. In September 1938 Britain, France, and Italy agreed at the Munich Conference to grant Czechoslovakia’s Sudetenland to Germany. In
return, Hitler gave Chamberlain his personal word on future cooperation. The Munich Pact is considered the height of appeasement. On his return to London, Chamberlain stated: “We regard the agreement signed last night [Munich Pact] and the Anglo-German Naval Agreement as symbolic of the desire of our two peoples never to go to war with one another again…. My good friends, for the second time in our history, a British Prime Minister has returned from Germany bringing peace with honor. I believe it is peace for our time…. Go home and get a nice quiet sleep.” Chamberlain resigned in 1940 and was replaced by Winston Churchill, who led Britain to the end of the war. The Molotov-Ribbentrop Pact of nonaggression signed by Germany and the Soviet Union in 1939 is also considered by some historians as an act of appeasement or as an attempt by Joseph Stalin to buy time to prepare for an impending German attack on the Soviet Union.

U.S. ENTRY INTO THE WAR
Since 1940 the United States had allowed the covert operation in China of the American Volunteer Group, or “Chennault’s Flying Tigers,” to assist the Chinese war effort. The Flying Tigers destroyed an estimated 115 Japanese aircraft, sunk numerous Japanese ships, and participated in the Burma land campaign. U.S. president Franklin D. Roosevelt cut exports of oil and scrap iron to Japan in 1941. Japan planned and executed a strike on Pearl Harbor, Hawaii, on Sunday, December 7, 1941, to cripple the U.S. Pacific fleet and consolidate oil fields in Southeast Asia. The attack on Pearl Harbor achieved military surprise and severely damaged the U.S. navy, and it remains the largest military attack on U.S. soil.

Following the Japanese attack on Pearl Harbor, Hitler declared war on the United States on December 11, 1941, in the hope that Japan would assist Germany by attacking the Soviet Union (it did not). Pearl Harbor, in conjunction with Hitler’s declaration of war, gave Roosevelt the domestic support he needed to join the war in Europe and Asia without meaningful opposition from Congress. Many historians consider this an important turning point of the war in Europe, marking the formation of a grand alliance of powerful nations (the United Kingdom, the United States, and the Soviet Union) against Germany.

POSTWAR DIVISION, OCCUPATION, AND RECONSTRUCTION
After World War II, Europe was informally partitioned into Western Europe and Eastern Europe under the NATO and Warsaw Pact military alliances and the Marshall Plan and Comecon economic arrangements. Germany was formally divided into the states of the Federal Republic of Germany (F.D.R., or West Germany) and the German Democratic Republic (G.D.R., or East Germany). Allied troops remained in Germany for decades following the war. Following German reunification in October 1990, the new united Germany still had Soviet troops stationed in its eastern provinces.

The U.S. Marshall Plan intended to rebuild the European economy and promote European unity while thwarting the political appeal of communism. For Western Europe, economic aid ended the dollar shortage and stimulated private investment for postwar reconstruction. The Marshall Plan required European states to work together to utilize the funds, an obligation that later facilitated the formation of the European Economic Community.

The Council for Mutual Economic Assistance (COMECON, Comecon, CMEA, or CEMA) was formed in 1949 as an economic organization of Communist states. Its original members were the Soviet Union, Bulgaria, Romania, Hungary, Czechoslovakia, Albania, the German Democratic Republic, and Poland. Albania, Hungary, Czechoslovakia, Bulgaria, and Romania, which were allied with the Axis Powers during the war, came under the Soviet sphere of influence, with their Communist governments joining the Soviet-led Comecon economic and trade area, as did Poland. In 1950 East Germany joined Comecon. (Other members included Mongolia [1962], Cuba [1972], and Vietnam [1978]. Yugoslavia [1964] was an associate member; other Communist countries or Soviet-friendly governments were observers.) Comecon members had common approaches to state economic ownership and planned management, and political regimes that espoused the ideologies of Marxism-Leninism. In 1949 the ruling Communist parties of the founding states were also linked internationally through the Cominform, the Communist Information Bureau, which established information exchanges between members. The East European members of Comecon were also militarily allied with the Soviet Union in the Warsaw Pact.

In Asia, the U.S. military occupation of Japan led to Japan’s democratization. China’s civil war continued during and after World War II, culminating in the establishment of the Communist People’s Republic of China. Europe’s Asian colonies India, Indonesia, and Vietnam started toward independence.

LEGACY OF WORLD WAR II
One of the most important legacies of World War II was the creation of a set of international institutions to provide for international governance of global security and monetary relations. Postwar security and economic institutions were created exclusively by the victorious Allied Powers and reflected the postwar power structure. The term United Nations was first coined by Roosevelt during
the war to refer to the Allies. On January 1, 1942, the Declaration by the United Nations committed the Allies to the principles of the Atlantic Charter and pledged them not to seek a separate peace with the Axis Powers. Thereafter, the Allies used the term United Nations Fighting Forces to refer to their alliance. The United Nations institutions were created during the war itself to govern international relations after the war.

The initial ideas for a global security organization were first elaborated at wartime Allied conferences in Moscow, Cairo, and Tehran in 1943. During August to October 1944 representatives from France, Britain, the Soviet Union, China, and the United States met in Dumbarton Oaks in Washington, D.C., to prepare plans for an organization that would maintain peace and security, and economic and social cooperation. The formal monetary conference predated the security conference: The United Nations Monetary and Financial Conference of July 1 to 22, 1944 (called the Bretton Woods conference), took place in Bretton Woods, New Hampshire, with 730 delegates from 45 Allied countries. It established the Bretton Woods system of international exchange-rate management that remained in place until the mid-1970s, and it produced two separate institutions (called the Bretton Woods institutions) to monitor, regulate, and facilitate international monetary affairs and finance in the post–World War II era. The World Bank and the International Monetary Fund, both headquartered in Washington, D.C., have had lasting influence on the international political economy since their inception. The International Monetary Fund was entrusted with overseeing the global financial system by monitoring exchange rates and balance of payments, providing liquidity, and offering technical and financial assistance. The World Bank, or International Bank for Reconstruction and Development (IBRD), was entrusted with providing finance such as grants or loans at preferential rates, technical assistance, and advice to countries for the purpose of economic development and poverty reduction, and for encouraging and safeguarding international investment. Although the World Bank's activities have evolved to focus on developing countries, the first loan issued by the World Bank was approved on May 9, 1947, to France in the amount of $250 million for postwar reconstruction; this remains its largest loan to date in real terms. World Bank loans and grants provide financing to countries that have no access to international capital markets.

The United Nations Conference on International Organizations opened at the Fairmont Hotel in San Francisco on April 25, 1945, with fifty nations and some nongovernmental organizations represented. Initially referred to as the United Nations Organization, the UN was comprised of several administrative bodies (General Assembly, Secretariat, Economic and Social Council, Trusteeship Council, and the International Court of Justice to adjudicate disputes among nations), the most prominent of which is the Security Council, where members resolve action on issues of war and aggression. (For example, all UN peacekeeping operations must be approved by the Security Council.) The United Nations Charter was signed on June 26, 1945, and the UN, headquartered in New York City, came into existence in October 1945 after the charter had been ratified by the five permanent members of the Security Council and a majority of signatory states. It replaced the League of Nations, which had been founded after World War I and had proved ineffective at preventing war and securing peace and order. The structure of the UN reflected the World War II victory, with the most powerful Allies—the United Kingdom, France, the United States, the Soviet Union, and China—holding the only permanent seats in the UN Security Council with veto power over decisions. The World Bank and International Monetary Fund came into existence a few months after the UN, in December 1945 following international ratification of the Articles of Agreement (called the Bretton Woods agreements).

Another legacy of World War II saw the development and use of many new technologies, including long-range missiles, jet aircraft, radar, and atomic (nuclear) weapons. Nuclear weapons were created in the top-secret Manhattan Project in the United States (with assistance from the United Kingdom and Canada) by an international team that included émigré scientists from Central Europe, initially out of fear that Germany would develop them first. (The Soviet Union became the second nuclear power in 1949.) Nuclear weapons have only been used twice in the history of warfare, both in the closing days of World War II by the United States against Japan, the first on August 6, 1945, on the Japanese city of Hiroshima, and the second on August 9, 1945, on the Japanese city of Nagasaki. Each use comprised the dropping of a single airborne atomic bomb (atom bomb, A-bomb, or simply "the bomb"). The bombs killed an estimated 200,000 people (mostly civilians) instantly, and twice as many later through the effects of radiation. The advent of nuclear weapons came only weeks after the signing of the UN Charter, providing immediate impetus to concepts of arms limitation and disarmament. The first resolution of the first meeting of the UN General Assembly on January 24, 1946, was "The Establishment of a Commission to Deal with the Problems Raised by the Discovery of Atomic Energy," which called upon the commission to make specific proposals for "the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction."

World War II atrocities and genocide in both Europe and Asia led to a consensus that nations must work to prevent such tragedies in the future. Another early objective
of the United Nations was to create a legal framework for considering and acting on complaints about human rights violations. The UN Charter obliges all member nations to promote “universal respect for, and observance of, human rights” and to take “joint and separate action” to that end. The Universal Declaration of Human Rights was adopted by the UN General Assembly in 1948 as a common standard of achievement for all.

World War II resulted in a fundamental shift in global power from the weakened British Empire to the United States and the Soviet Union. Almost immediately following World War II, a protracted geopolitical, ideological, and economic struggle emerged between two of the most powerful Allied Powers—the United States and the Soviet Union. The struggle was called the cold war because it did not involve direct armed conflict between the United States and the Soviet Union, although each formed an opposing military alliance in Europe and engaged in the biggest arms race (including nuclear weapons) in history. The cold war lasted from about 1947 to the collapse of communism in the late 1980s, the fall of the Berlin Wall in 1989, and the dissolution of the Soviet Union in 1991.

The North Atlantic Treaty Organization (NATO, or the North Atlantic Alliance, Atlantic Alliance, or Western Alliance) was established with the signing of the North Atlantic Treaty on April 4, 1949, in Washington, D.C., for the purpose of collective security of the members, binding each to a military alliance with all the others. The treaty avoids identification of an enemy or concrete measures of common defense, but the implied adversary was the Soviet Union. This marked a significant change in the isolationist tendencies of the United States and signaled the lasting involvement of the United States in European security affairs. It also formally divided the World War II Allies in the West from the Soviet Union by creating a new military alliance composed largely of World War II Allied Powers. The original members of NATO were the United States, France, Britain, Belgium, Luxembourg, Netherlands, Portugal, Norway, Denmark, and Iceland (West Germany was not incorporated until 1955, after the formation of the Warsaw Pact).

In 1955 the Warsaw Pact (Warsaw Treaty, or Treaty of Friendship, Cooperation, and Mutual Assistance) was established as a military organization of Eastern and Central European Communist states to counter the threat perceived by NATO. Its members consisted of the Soviet Union, Bulgaria, Czechoslovakia, Hungary, Poland, Romania, East Germany (in 1956), and Albania (which withdrew in 1968). Similar to the NATO members, the Warsaw Pact signatories pledged to defend each other if one of them was attacked. It is noteworthy that the members of the Warsaw Pact consisted of Axis Powers as well as Allied Powers (the Soviet Union and Poland). The Warsaw Pact officially dissolved in 1991. Although not a member of NATO, the Axis Power Japan became allied with the United States. Although not a member of the Warsaw Pact, the Allied Power China was friendly to the Soviet Union. Countries such as Yugoslavia, Switzerland, Austria, India, Sweden, and Finland conspicuously maintained their neutrality by participation in the Non-Aligned Movement.

**WORLD-SYSTEM**

The great French historian Fernand Braudel coined the term *économie-monde* (world-economy). The hyphen is important; it signifies that he did not mean that his “economy” covered the whole world, merely that it was effec-
World-System

According to Wallerstein, if we exclude small-scale societies, which he calls mini-systems, where a complete economic division of labor is accompanied by a single culture, we have only world-systems. Of these there are just two variants. The world-empire has many cultures but a single political superstructure (and a division of labor). The world-economy possesses a single economic division of labor. Unlike the mini-system and the world-empire, it has both many cultures and many political units. The capitalist world-economy started in sixteenth-century northwestern Europe and has continued to exist ever since, unlike other (non-capitalist) world-economies and world-empires. Capitalism is a system given over to the unlimited accumulation of capital through exchange. It is driven by the search for profit. Profit comes from unequal exchange (a term pioneered in the Latin American context), whereby goods produced under monopolistic conditions in the core are traded for other goods produced in the periphery under competitive conditions; that is, non-monopolistic ones, in many countries. The former goods enjoy a cost advantage over the latter. This is because the sale price is high relative to the cost of production, whereas, in contrast, peripheral producers are forced to sell cheaply, close to or at the cost of production. (*Surplus value*, for Wallerstein, is the difference between cost of production and sale price of a product.) Goods produced under competitive conditions in the peripheral zones of the capitalist world-economy tend to flow to countries located in the core of the capitalist world-economy. Profits are highest to producers located in this core. The states located in the core are used by leading capitalists to prop up the system. Trade within this system, in which they enjoy a marked, historically unprecedented freedom of maneuver, benefits the latter unequally.

Wallerstein likens his interest in the historical development of the capitalist world-economy, seen as a single “unit of analysis,” to that of the astronomers in the single planetary system, the laws of motion of which they set out to discover. It is the world-system as a whole that interests him. This overall system determines what goes on in any particular part. Nation-states are only one institution among others in the capitalist world-economy. What goes on in them is determined less by the character of a particular nation-state and far more by this state’s position within the capitalist world-economy.

From 1540 the geographical area of northwestern Europe emerged as the “core.” Eastern Europe and Iberian America were reduced to peripheral status in relation to this core. Mediterranean Europe settled into an intermediate position, becoming semiperipheral, midway between core and periphery within the system. Its trade, state structure, and forms of labor exploitation reflected this intermediate position, just as in the cases of the core and the periphery. Subsequent phases of development saw industrial capitalism appear in the core; the European world-economy spread to encompass the entire globe; and changes within the core, semiperiphery, and periphery. The periphery includes most of Asia and Africa, the semiperiphery at various times Japan, the United States, Germany, and Russia. After 1945 the United States assumed a leading role in the whole system, closely followed by, among others, Soviet Russia. The USSR, although nominally a socialist state, could not, in Wallerstein’s judgment, possibly have been one. There is just one capitalist world-economy to date, and there can as yet be no socialist systems. Socialism awaits the qualitative change of the whole system, which, following deepening crises, will eventually assume the form of a world government. This revolution is preparing itself mainly in the periphery of the capitalist world-economy.

**WORLD-SYSTEMS ANALYSIS**

Capitalism requires a world economy. This is because it requires capitalists to be free of political interference—that is, free to accumulate; capitalists also require a large market, so cannot inhabit a mini-system. It is the continuous accumulation that has provided the system with its dynamism over five hundred years. Competition between capitalists is continuous. The division of labor, implying the exchange of basic goods and significant flows of capital and labor, alone binds the system together. It can do so because of the expansive properties of capitalism that have enabled capitalism to survive and grow continuously. (Noncapitalist world-economies have not survived.) Capitalists, to flourish, need to be able to evade states hostile to their interests and to pressure other states into pursuing policies favorable to those interests. They need a multistate world-system. Profit comes from state-supported quasi-monopolies. Capitalists in the core can charge high prices but producers in the periphery are in no position to do so.

Core countries are few. Peripheral ones are many. The semiperipheral countries (e.g., South Korea, India, and Brazil) aim to move up to the core and to avoid falling down into the periphery. They have a mix of activities—some are core-like, some are periphery-like—whereas in core and periphery countries, core and periphery activities are respectively preponderant. Surplus value flows in the core from the working class to the employers, but it also flows from the periphery to the core in world-system terms via trade. Analysts detect long cycles of expansion
and recession over about sixty-year periods (known as Kondratieff cycles). These occur as quasi-monopolies become exhausted. Recovery from recession does not bring the world-economy back to where it was before the cycle started. “Secular” or long-term trends are visible. Eventually these create problems for the system.

Cultural phenomena are interpreted by Wallerstein in terms of his world-system model. Subsequent to the publication of his historical-sociological trilogy (The Modern World-System, 1974, 1980, 1989), Wallerstein has treated these phenomena in response to the criticism that he had neglected them. The world-system, he argues, now has a “geoculture.” Central to it is “centrist liberalism.” Principles of universalism (equality of opportunity, meritocracy) applicable to the managerial cadres are offset and balanced by de facto particularisms—of race, nation, ethnicity, gender, and religion. These legitimate the various divisions within the capitalist world-system—for example, states promote “nations”; the core-periphery division encourages divisions of “race”; and households placed at a lower level in the world occupational hierarchy socialize their young into consciousness of ethnic identity and uphold the mainly unpaid labor of their female members through sexism. These particularistic definitions involve lines of social division that are drawn and redrawn in the workforce as divisions within the capitalist world-economy change: changes in the position of countries in the long-term cycles and in overall tendencies toward crisis, and adaptive responses to particular crises of the system as a whole. Semiproletarian households that predominate in the periphery today effectively subsidize capitalists in the core (where truly proletarian households fully supported by wage labor predominate). Such households permit workers and their families to survive through means of support other than wage labor, such as subsistence and petty trading, thus allowing wages to fall below what otherwise would be necessary to ensure the survival of the whole household.

Just as the modern world-system of today has a single culture, the content of which was initiated by the ideals of the French Revolution, so too it has an interstate system. Here again, this system follows in its workings the patterns visible in the world-economy to which it is bound of necessity. The actions of states influence the workings of the capitalist world-economy through their relations to their capitalists and to foreign states, especially in other “zones,” and their relative strengths and weaknesses vis-à-vis each other are determined by their relative economic success as taxing and military entities.

Wallerstein and his colleague Terence K. Hopkins built a successful research school, the Fernand Braudel Research Center at the State University of New York, Binghamton. Fellow analysts include Samir Amin, Christopher Chase-Dunn, Giovanni Arrighi, Albert J. Bergesen, and, notably, André Gunder Frank, whose metropolis-satellite model was effectively replaced by the world-system. A list of former students produces a series of illustrious names in American social science, many of whom, with others who are not world-systems scholars, have attempted to synthesize the world-system approach with ideas from other traditions. World-systems analysis should not be seen in isolation.

World-systems analysis and orthodox Marxism overlap in many ways, despite significant differences. Marxists of the stature of Rosa Luxemburg (1871–1919) (see The Accumulation of Capital, [1913] 1951); V. I. Lenin (1870–1924), whose analysis bears some striking resemblances to Wallerstein’s; and N. I. Bukharin (1888–1938) (see Imperialism and the Accumulation of Capital, [1924] 1972) struggled with the problem of imperialism, as did J. A. Hobson. (It should also be noted that the non-Marxist scholar Oliver Cromwell Cox’s The Foundations of Capitalism (1959) anticipated Wallerstein’s conception in certain noteworthy ways.)

The central issue dividing orthodox Marxism from world-systems theory is whether analysis should focus on class relations within a given national mode of production, pivoting on the wage contract. The defense of this position has been made by Robert Brenner (1977) and has led to the charge that Wallerstein’s is a neo-Smithian Marxism—a charge with which other critics like Theda Skocpol (who argues for a degree of state autonomy allegedly denied by Wallerstein) have some sympathy (1977). Wallerstein’s dating of the origins of the capitalist world-economy means that he cannot subscribe to these tenets, and his conception of the role of states in monopolies, of the world-system in which states are contained as the relevant totality, and of the historical variety of forms of labor control (not just wage labor) necessarily denies them too. The issue dividing Marxists from non-Marxists is the primacy to be accorded to economic relations: Are they primary or not? And how are states and culture to be understood relative to economic matters? Whatever the answers to these profound, complex questions, Wallerstein and his colleagues have opened up questions previously considered closed. In their scholarship, fact and theory are brought into a fruitful relationship, as in the days before modern social science replaced historical sociology with the abstract “science” of society.

WORSHIP

The term worship refers to a complex of acts whereby humans express their devotion and reverence toward a deity (in theistic religions) or toward a transcendent yet nondivine being (in nontheistic religions). Arguably, as soon as human individuals become conscious of their utter dependence on a supernatural power and express their devotion to him, her, or it, worship is born. While this private worship is undoubtedly valid, conventionally worship refers to the public and corporate acts of devotion performed in an organized religion. Furthermore, the three pronouns—in the masculine, feminine, and neutral genders—used above to refer to the deity (alternatively, deities) or the transcendent but nondivine being(s) indicate the diverse ways they are conceived, either as personal (male and female) or impersonal, as singular (monotheistic) or as plural (polytheistic). This entry focuses on worship rendered to a personal deity, male or female, in theistic religions.

Studies of religion have shown that there is a reciprocal relationship between worship and belief and that in this relationship the former is prior to the latter. The first human reaction to the presence of the tremendum et fascinans— to use Rudolf Otto’s (1869–1937) expression for the sacred—is not to formulate beliefs about it but to worship it in awe and devotion. This worship eventually gives rise to theological reflections and beliefs, which in turn shape and regulate the rituals in which worship is carried out.

One of the most fundamental forms of worship is sacrifice. These rituals are performed publicly, in the open air or in religious buildings, and privately, among family. Religious officials generally preside at public sacrifices, whereas the male head of the household often, but not always, presides over worship in family settings. In Daoism and Buddhism, for instance, worship, including sacrifices, may be undertaken by women as representatives of the family. Various objects are offered to the one God, gods, spirits, ancestors, demonic beings, or any other transcendent being. In bloodless sacrifices, food and drink, such as fruits, grains, and baked goods, milk and milk products, water, alcoholic beverages, and flowers, are offered. Inanimate objects are offered too, including clothing, jewelry, coins, precious stones, and precious metals. In blood sacrifices, domesticated animals and, less often, humans are ritually slain, and their blood is sprinkled on the altar or on the fields to maintain the cosmic order or promote fertility. The sacrificial rite may be a simple act of lifting up the offering, killing or burning the animal, and the libation of its blood. Eventually, the rite can become highly complicated, requiring performance by religious experts. The intentions of sacrificial worship are described as fourfold: praise, thanksgiving, supplication, and expiation. Sacrifices are offered regularly (daily, weekly, monthly, at the beginning of seasons, and yearly) and extraordinarily (for special joyful events or on dangerous occasions) and at various sacred sites, both natural (e.g., trees, mountains, rivers, and stones) and constructed (e.g., temples, pagodas, and churches).

Ritual worship varies greatly from religion to religion, from age to age, and from place to place. In Vedic practice and later Hinduism, the central sacrifice is the offering of fire, personified as the god Agni and the symbol connecting Vedic understandings of the person, society, and the cosmos. In addition, worship of deities through the offering of foods, service, and gestures of respect toward the deities (pūjā), later amalgamated into devotional (bhakti) Hinduism, is one of the most pervasive forms of Hindu worship. This worship takes a variety of forms, from simple gestures, such as offerings of water, foods, and flowers, recitation of mantras, singing of songs, and the waving of camphor before the image of the deity, to more elaborate gestures, such as offering hospitality to the god, invocations, bathing and dressing the image, and carrying the enshrined image in procession. Central to this pūjā is the experience of “auspicious seeing” (darsana), in which the devotee “sees” the god or goddess and is “seen” by those who are granted favors by the deity, symbolized by the returning of the sacred food (prasāda).
In ancient Israel, sacrifices at the Jerusalem Temple, officiated by the priestly class, played a pivotal role in the religious life of the people until the destruction of the Temple in 70 CE. In terms of ritual, in pre-Rabbinic Judaism a distinction is made between burnt offerings (“holocaust”), in which the sacrificial animal is totally burned up, and peace or communion offerings, in which only parts of the sacrificial animal are burned, with the animal’s blood poured out or smeared on the altar and some parts of the animal consumed by the people in a sacrificial meal. In expiatory sacrifices, the sacrificial animal is burned up and no part of it is eaten. Ancient Israel also practiced bloodless sacrifices consisting of the offering of agricultural products. These sacrifices, blood and bloodless, were made daily and on solemn festivals, such as Passover, Shavu’ot, Yom Kippur, and Sukkot. With the destruction to the Temple, the whole Jewish sacrificial system came to an end, and new forms of worship arose with the emergence of the rabbis as spiritual leaders.

According to Christianity, the Jewish sacrificial system and worship reached their culmination in Jesus’s death on the cross, which is seen as the perfect and definitive sacrifice, bringing about the redemption of the world. Jesus’s life, ministry, death, and resurrection are made efficaciously present (not repeated) in the sacraments—there are seven of these in the teaching of the Roman Catholic Church. Of them, the highest is the Eucharist, the perfect sacrifice, in which Jesus’s body and blood are believed to be physically and really present and the spiritual benefits of Jesus’s sacrifice on the cross are imparted to his followers and constitute the church as his mystical body. Christian worship is often called liturgy, that is, the whole public worship of the mystical body of Jesus Christ, head and members.

Islam is in principle opposed to sacrifice. Consonant with its fundamental belief in the unity of God (tawhîd) and in Muhammad (c. 570–632) as the final prophet, Islam emphasizes worship as “service” (‘ibâdah) to God and veneration of the Prophet. This worship/service constitutes the so-called Five Pillars of Islam: the confession of faith (shahâda), ritual prayer (salat), fasting (sawm) during the month of Ramadan, the pilgrimage (hajj) to Mecca, and almsgiving (zakat).

Whereas sacrifice occupies an important place in theistic religions, it is by no means the only form of worship. In all the religions examined above, the reading and study of the scripture constitutes an essential part of worship. In Hinduism, the study of the sacred books is combined with ascetic (tapas) and meditation (yoga) practices. In Judaism, after the destruction of the Temple and in the subsequent Diaspora, a class of nonpriestly leaders called rabbis sought to construct a system of worship in which the study of the Torah is a central mode of honoring God. This Torah piety also provides insights into the commandments (mitzvot) that govern the lives of devout Jews. To replace the Temple sacrifices, the rabbis composed prayers for the use of their synagogues (such as the Prayer of Eighteen Blessings) and introduced the practice of reciting Deuteronomy 6:4–9 and 11:13–31 and Numbers 15:37–41 (the shâmah’). Worship is conducted in the presence of the Torah scroll, and the leader of the worship stands in front of the ark housing it. Another innovation is the public reading of the Torah and exposition of scripture. In Christian liturgy, scriptural readings, from the Old and New Testaments, are incorporated into the liturgy and are often followed by a homily. In Islam, the Qur’an is the object of ubiquitous veneration and devotion. Wrapped in silk, it is stored as the most sacred object in the room and must not be handled in a state of ritual impurity.

The reading of sacred scripture also plays a key role in other religions, such as Sikhism and Buddhism. The Adi-Granth, draped in silk and placed on a cot under an awning, is the central object of worship in every Sikh gur-duwârâ, and offerings of money, flowers, and food are made to it. On special occasions there is nonstop recitation by a relay of readers. In Buddhism, the simplest act of devotion is homage in front of the image, usually of the Buddha, accompanied by an offering of flowers, incense, and candles. In this ritual the devotee, particularly in the Theravada tradition, takes refuge in the three jewels, that is, the Buddha, the dhamma (teaching), and the sangha (community). Because of the emphasis on the Buddha’s teaching, one important component of Buddhist liturgy is the recitation and chanting of the sacred texts, such as the tipitaka. In Tibetan Buddhism, the reading by a monk of a specific text, often a version of the Prajñâpâramitâ in 100,000 verses or 8,000 verses, is done if possible once a year in each household to insure blessings for the family.

In addition to the official liturgy, other acts of worship, conventionally referred to as popular religion or devotion, play a no less important role in the piety of the faithful. Among these are fasting (e.g., during Ramadan for Muslims, during Lent for Christians, on certain festivals for Jews, and throughout the year for Buddhists), pilgrimage (e.g., the hajj for Muslims, circumambulation in Tibetan Buddhism, visits to sacred places for Hindus, Buddhists, and Christians), meditation (in yoga, Zen Buddhism, and Daoism), ancestor worship (in Confucianism) and the feeding of hungry ghosts (in Buddhism), veneration of saints (in Roman Catholicism and Orthodoxy), the cult of relics and images (in Roman Catholicism and Buddhism), life-cycle rituals (the sam-skâra in Hinduism and the sacraments in Christianity), the sanctification of time by means of the Liturgy of the Hours and the sacred calendar, the taking of vows, healing and exorcism, and so on.
Worship is the lifeblood of religion. Ever-changing and yet permanent, this universal phenomenon represents the response, both of the individual and the community, to the presence of God or a supernatural being. While historical and theological studies of worship have revealed much of its nature and developments, much still remains controversial, especially regarding the origins of worship and sacrifice, the relation between worship and ideology, the social dimensions of worship and devotion, the role of goddesses and women in worship, the relation between worship and personal cultivation in meditation, the relation between the local and translocal traditions of practice, and the impact of postmodernism and globalization on worship.

X-CRISE

X-Crise is an acronym for the Centre de Renseignements et d’Informations Sociales et Économiques, an association created by alumni of France’s elite École Polytechnique; this association was later known as the Centre Polytechnicien d’Études Économiques (CPEE). X-Crise was formed in 1931 by Gérard Bardet, manager of the Bardet company, who became CPEE’s general secretary; André Loizillon, whose career in industry spanned companies from Schneider to Shell and who was CPEE’s treasurer for a while and a member of X-Crise’s transport workshop; and John Nicoletis, a consulting engineer and manager specializing in less-developed countries. X-Crise’s purpose was to examine the causes of the world economic crisis and propose possible solutions. From a membership of about twenty Polytechniciens in October 1931, it grew to close to two thousand members (not all Polytechniciens) in 1939, the year the association disbanded. As an open, tolerant, and scientific think tank, X-Crise gathered together liberals (in the French sense of the word; i.e., market-oriented economists) like Clément Colson, Jacques Rueff (both teachers at the Ecole Polytechnique), Alfred Sauvy, and Henri Michel; socialists personalities like John Nicoletis, the tireless Jean Coutrot, Jules Moch (a socialist deputy and close relative of Charles Spinasse’s), and the French historian Marc Bloch; and centrists such as Gérard Bardet, Auguste Detouef (Alsthom’s founder), and André Loizillon.

X-Crise was not a research center as one finds in universities. It was a network of Polytechniciens, graduates considered to be part of the elite of the French nation, together with some non-Polytechniciens, all united around a mission: to get France out of economic crisis through intervention both in government, as experts in macroeconomics, and in industry, as managers skilled in the scientific organization of work. But if some of these Polytechniciens had already applied the scientific organization of work to their own firms, none of them, initially, was expert in macroeconomics. Hence, X-Crise organized meetings and published working papers in the École Polytechnique’s bulletin. Small workshops were created to focus on particular topics like econometrics (Fischman and Lendjel 2000b), transport, finance, foreign experiences, and the study of the present state of the economy. Their members were volunteers; while they published many reports in X-Crise’s bulletin, they were never academic researchers trying to obtain intellectual fame in France and abroad. Yet because X-Crise’s aim was also to help Polytechniciens become France’s macroeconomics experts, X-Crise became a magnet for innovative economic studies.

Two bodies of economic work that were very innovative for France in the 1930s have to be mentioned here: Maurice Potron’s (Abraham-Frois and Lendjel 2004), and the economic models of François and Georges Guillaumé and François Moch (brother of the socialist deputy Jules Moch). Indeed, as early as 1911 Maurice Potron applied Perron-Frobenius’s theorems to a Leontief-type model, in order to find the conditions for the existence of a “satisfactory economic regime.” He also laid the foundations of input-output analysis in work published in 1912. The works of the Guillaumé brothers and of François Moch provided one of the first economic models in France. The Guillaumé brothers’ model (Guillaumé 1932; Fischman and Lendjel 2000a) can be considered a draft of the French...
Xenophobia

Xenophobia is discrimination against and hatred of foreigners, targeting outsiders and strangers or more often those who are in effect part of one’s own society but are perceived as incommensurably different from the majority population. The most pointed, long-term, and widely documented case of xenophobia is that of anti-Semitism, which culminated in the mass murder of six million European Jews and countless others during World War II (1939–1945). A new form of xenophobia that grew in western Europe and North America during the late twentieth century and early twenty-first century is Islamophobia, which targets migrant Muslim communities with or without citizenship.

CAUSES AND CHARACTERISTICS

Anti-Semitism and other forms of xenophobia often are said to be related to the innate characteristics of a given culture or a consequence of economic malaise and political turmoil in select societies. The typical example given for such an assertion is Germany. These explanations are not only insufficient, they also lead to normalization of the hatred and violence commonly associated with institutionalized practices of exclusion and discrimination. The problem of hatred of foreigners and intolerance for ethnic, religious, racial, and cultural difference must instead be put into the larger context of dominant political movements and ideologies with a transnational dimension.

There are observable links between migration, racism, discrimination, ethno-religious stereotyping, and xenophobia. Increased ethno-religious and racial diversity

national accounting system. Moch’s model (Moch 1933–1934; Fischman and Lendjel 1999), designed to explain the positive consequences of a cut in working hours on the level of economic activity, presented some Keynesian arguments. Firstly, it pointed out the important role of demand as an economic motor; secondly, it demonstrated the need for the state to intervene in order to get the economy out of a downward economic spiral; and, thirdly, it made an argument quite close to the acceleration principle of R. F. Kahn that Keynes used. Guillaume and Moch attempted also to test their theoretical models with statistical facts. This led Moch to elaborate an econometric “method” of interpreting economic cycles.

Even in X-Crise, these works did not have a large audience. But they have had a great impact on subsequent thinking, as have other X-Crise writings and debates. Indeed, as Michel Margairaz wrote, there is “no doubt X-Crise has eased Ecole Polytechnique’s conversion to economics, as well as [that of] the State experts to macroeconomics, more or less explicitly inspired by Keynesianism” (Margairaz 1995, p. 181). In fact, before, during, and after World War II, some of X-Crise’s members—such as Charles Spinas, Georges Boris, Jacques Branger, Jean Coutrot, Georges Guillaume, Louis Rosenstock-Frank, Alfred Sauvy, Jean Ullmo, Robert Gibrat, Lucien Romier, Robert Loustau, Gérard Bardet, Auguste Detouef, Louis Vallon, and François Divisia—had high positions in the country’s administration, especially in ministries in charge of economic matters. For example, X-Crise members served in the Ministry of National Economy (MEN in French)—a true instrument of political economy—in 1936; in the Vichy government in the public works department, in communications, and in the ministry of production; and, finally, in General De Gaulle’s administration.

in societies makes the reality of the heterogeneity of human communities more obvious. In the absence of political, legal, social, and economic mechanisms to ensure mutual respect and to mediate relations across differences, xenophobia and various related forms of racism become manifest. Particularly among European societies that received substantial numbers of immigrants after World War II both as workers and as asylum seekers, migrants with a different skin color or religion became the targets in violent internal disputes about authentic national identity. This indicates that despite the en masse elimination of Jews from Europe, xenophobia did not loosen its grip across the Continent. Still, xenophobia was by no means an exclusively European phenomenon. In an era when first nation-state politics and then neoliberalist policies increased societal and economic inequalities, and societies grappled with the changing realities of their multietnic, multireligious, or multiracial makeup and often arbitrarily carved national borders, a marked increase was seen in discrimination and violence directed toward migrants, refugees, and minorities on a global scale.

**XENOPHOBIA AND RACISM**

Although racism and xenophobia are distinct phenomena, they are closely interrelated. Racism generally implies value-laden distinctions based on presumed or aggrandized differences in physical characteristics, such as skin coloration, hair type, facial features, and body type. Xenophobia, by contrast, is the perception that people and communities identified as “other” are foreign to a given community or society, that they lack the capacity for integration, and that they can bring harm to the authentic identity of the majority. Racism is an ideological construct; it assigns a certain race or ethno-religious group a position of power and privilege on the basis of the group’s physical and cultural attributes. It involves the establishment and sustenance of hierarchical relations in which the self-appointed superior race exercises domination and control over others. Xenophobia too refers to attitudes, prejudices, and behavior that reject, exclude, and vilify its targets based on the belief that they are perpetual outsiders who cannot be included or trusted. Consequently it is sometimes difficult to make a clear distinction between racism and xenophobia because they exhibit similar motivations for exclusive behavior designed to demean others and the exercise of political violence. However, there is one element missing in racism that is often present in xenophobia: religious identity. Manifestations of xenophobia occur not only against people with different physical characteristics but also against those of similar background who are believed to hold different and presumably dangerous and hostile religious convictions.

**INITIATIVES AGAINST XENOPHOBIA**

Even in societies with a long history of legalized discrimination, it is possible to take measures to alleviate or at least curtail the culture of hatred aimed at those deemed essentially unassimilable. The Roll Back Xenophobia campaign established in South Africa in 1998 is a succinct example of how political will and determination can produce a widely visible and national effort to confront systematic incidences of xenophobic hostility and violence. The campaign began as a joint initiative between national and international institutions: the South African Human Rights Commission, the National Consortium on Refugee Affairs, and the office of the United Nations High Commissioner for Refugees. It emphasized broad, multifaceted, and synchronized activities by the government, civil society organizations, and communications media, including information campaigns by national and local governments, retraining of the police force, strengthening of labor rights protections for migrant workers, sensitization of trade union officials, awareness raising by religious organizations, reinstatement of codes of conduct for civil servants, and the inclusion of migration- and refugee-related concerns in primary, secondary, and tertiary education. These measures, in the larger context of the antiapartheid movement in the country, were suggestive of a tidal wave of change in South Africa in terms of how its citizens began to deal with differences that had violently divided the society in the past.

Another example that points in a positive direction is reforms made in Canadian immigration policies beginning in the 1980s. Immigration and refugee policy discussions are rarely separable from general debates on racial, interethnic, and interreligious relations within host communities. Therefore strong border controls are often advocated as necessary for dealing with and controlling the status of racial, cultural, or ethno-religious minorities by the dominant culture. Still, while immigration controls have historically discriminated between nationalities, ethnicities, and religions, the Canadian example proved that it is possible to alleviate at least the overt marks of racism or xenophobia via institutional reforms and policy changes.

Xenophobia is clearly observable when immigration procedures target particular ethno-religious groups for exclusion or lack transparency or when the immigration process itself is made so grueling for select groups that it can act as a deterrent. With regard to refugee applications, for instance, the systematic use of detention often singles out specific nationalities or ethno-religious groups more than others. Meanwhile many refugees have no choice other than to use irregular entry, increasingly at the hands of smugglers. Thus they run the risk that their irregular
migration will be held against them in their asylum claim, and if they gain entry, they will be set apart from other minorities and mainstream society. This tension has been clearly observable in European Union (EU) policies regarding refugees and asylum seekers. In this regard the establishment of the European Monitoring Centre on Racism and Xenophobia (EUMC) in Vienna by the European Union in 1997 and the successive creation of the European Union Agency for Fundamental Rights on March 1, 2007, were important initiatives to develop regional institutional mechanisms for monitoring and countering xenophobia. They kept records of the racial and xenophobic discrimination and violence directed toward migrants and other ethno-religious minorities in Europe. They also identified and highlighted examples of good practices in challenging and remediying xenophobic policies.

The global nature of violence and discrimination against migrants, refugees, and settled ethno-religious minorities has also been increasingly acknowledged by the post–World War II international human rights community. By 2007 there had not yet been wide acceptance by signatory states of the basic rights and entitlements for unauthorized migrants recognized in the United Nations 1990 International Convention for the Protection of the Rights of All Migrant Workers and Members of Their Families. However, under the International Labor Organization Conventions related to migrant workers, undocumented migrants are entitled to equal treatment with respect to rights related to their present or past employment, including issues of remuneration, social security, and other benefits as well as trade union membership and exercise of trade union rights. The undocumented migrants and refugees remain especially vulnerable because they were either unwilling, out of fear of being deported, or unable to seek protection from authorities when confronted with xenophobic violence.

RESURGENCE OF RIGHT-WING POLITICS

Increasingly after the 1980s Europe witnessed growth in racism and xenophobia that began to swamp its politics. In June 2004 elections for the European Parliament, twenty-five representatives of ten neo-Nazi and extreme right-wing parties from seven member states won seats. Although xenophobia and the growth of neo-fascist and far-right parties in Europe had long been held in check by the memory of the atrocities of Adolf Hitler’s Germany, subsequent developments suggested that the situation had started to change and new forms of counteraction needed to be developed. In Austria the radical right-wing Freedom Party, led by Jörg Haider, won an unprecedented 27 percent of the vote in national elections in 2001 and ascended to power. The EU, of which democratic Austria is a member, immediately imposed diplomatic sanctions, citing the Freedom Party’s long history of xenophobia and Nazi sympathies. Meanwhile although the EU categorically denounced Haider’s anti-immigration agenda, its own member nations also instituted policies that excluded nonwhite immigrants from entering the Continent. While Austria markedly tightened its immigration and asylum rules in the aftermath of the Yugoslav crisis, several European countries also introduced new legislation restricting immigration and asylum, citing the need to respond to growing xenophobia in European societies and thus inadvertently blaming the immigrants and refugees for the societal reaction against them. In addition although the rise of the right in British politics during the late 1990s and the early 2000s was not a revival of the classic fascism of the 1930s, the xenophobic and racist tendencies embodied by the new movement had similar characteristics. Furthermore skinheads, neo-Nazis, and other xenophobic movements that emerged in the aftermath of German unification exhibited a shift in anti-Semitic and antiforeigner violence and demonstrated an increasing connection to local and ideological networks with aggressive elements. These European movements found support in national politics to an extent that would have been unimaginable in the 1970s. Following Haider’s success in Austria, in Italy’s May 13, 2001, general election Umberto Bossi and his religious and xenophobic Northern League party became a full governing partner in the center-right coalition led by Silvio Berlusconi. The league was the party most loyal to Berlusconi’s government until 2006, and it held the three ministries of Labor and Social Affairs, Justice, and Institutional Reforms and Devolution.

The increase in xenophobic sentiments toward migrant and refugee populations in European societies was examined by data compiled from four waves of Eurobarometer surveys in twelve countries between 1988 and 2000. The resultant analysis showed a substantial rise in antiforeigner, xenophobic sentiments and fears between 1988 and 2000 in all twelve core European countries. The analysis also proved that antiforeigner sentiment is much more pronounced in places with greater support for right-wing extremist parties and fascist movements. According to these findings, the impact of individual-level socioeconomic characteristics such as education remained stable over the years, but the effect of political ideology increased. In this context, formation of civil society organizations such as the European Coalition of Cities against Racism constituted an important step toward combating xenophobia in Europe. Linked with the International Coalition of Cities against Racism, an initiative launched by UNESCO in 2004 to establish a network of cities interested in sharing experiences in order to improve poli-
cies to curtail racism, discrimination, and xenophobia, a ten-point plan of action was formulated by the European coalition. These comprised areas such as increased competence of city authorities in education, housing, and employment as well as cultural and sport activities for combating racism and xenophobia and suggested practical policies that city authorities might develop. To the same end of combating xenophobia, the United Nations World Conference against Racism, Racial Discrimination, Xenophobia, and Related Intolerance (WCAR), held in September 2001 in Durban, South Africa, was a gathering that provided nongovernmental organizations (NGOs) representing minority populations and historically oppressed groups an opportunity to speak against their governments over human rights violations.

ISLAMOPHOBIA
After the World Trade Center bombings in the United States in 2001, there emerged an alarming surge in racism and xenophobic actions against people of Arab background and Muslim faith across Europe and North America. This phenomenon, called Islamophobia, denoting fear of Islam and Muslims, made life particularly difficult for Arab and Muslim Americans after the September 11 attacks. Many were harassed at work, had their property vandalized, and were subjected to regular security checks. Although public leaders, including President George W. Bush, called for tolerance, the Council for American-Islamic Relations (CAIR) in Washington, D.C., counted some 1,700 incidents of abuse against Muslims in just the 5 months following September 11. In response to these developments in 2004 the United Nations held a conference called Confronting Islamophobia: Education for Tolerance and Understanding at its New York headquarters. Attended by more than 600 delegates, the event was part of the progressive initiative organized by the United Nations Department of Public Information seeking to improve awareness of xenophobia.

Criticisms of Islam and anti-Muslim political rhetoric have been intertwined with cultural and ethnic hostility that extends even to secularized immigrants from traditionally Muslim societies. As early as 1997 the Runnymede Trust in the United Kingdom issued a report on Islamophobia, revealing widespread hatred of Islam and Muslims across all sections of British society. Similarly, the November 2005 riots in which minority ethnic youths in France took part exposed a deeply entrenched racism in the country. Both the riots and the response to them, which involved the invocation of emergency law, the imposition of curfews, and the deployment of thousands of police, brought into the open the xenophobic aspects of France’s secular republicanism. These events were followed by the debate over the publication of Danish cartoons of the Prophet Muhammad, based on the assumption that Muslims do not have any experience of freedom of speech or do not believe in the concept. In the United States and Canada the growing threat to civil liberties and the resultant alienation experienced by many Muslims or citizens of immigrant background from traditionally Muslim societies also constituted direct examples of xenophobia. In Britain the 2005 London bombings led to new antiterrorist legislation advanced by the government of Prime Minister Tony Blair, ultimately scapegoating past policies of multiculturalism and targeting Muslim communities as a whole.

Immigration has historically been associated with xenophobia. In periods of high unemployment and global dislocation, immigrants easily become the targets of political leaders who accuse them of criminality, lack of morals, making excessive demands on public services, and creating undue competition for scarce employment. Meanwhile the danger represented by the rebirth in eastern Europe of highly aggressive forms of nationalism; the growth of xenophobia in western Europe both as increased anti-Semitism and as Islamophobia and racism against people of Asian, African, and Caribbean background; and the increase in the strength of the extreme right and xenophobic politics in the United States suggest that xenophobia cannot be eradicated purely by procedural democracy or welfare state policies. Lack of respect for difference and of the political will for negotiating national identities in the face of change constitute challenges that feed reformulations of xenophobia even at the very bastions of pluralism and tolerance.

YELTSIN, BORIS
1931–2007

Boris Nikolaevich Yeltsin was the founding father of the post-Communist Russian state, and the man responsible for giving shape to contemporary Russian democracy. His life reflected the sufferings and achievements of the Soviet era, and also came to symbolize the chaos and confused aspirations of the capitalist democracy that came after. Yeltsin was born on February 1, 1931, in the village of Butka some 250 miles east of Yekaterinburg (called Sverdlovsk at the time). In that year the region was engulfed by Stalin’s savage struggle to force peasants off their individual plots and into collective farms. Yeltsin’s family was comparatively prosperous and therefore, as kulaks (rich peasants), were exiled to the east. With the countryside in chaos, in 1932 Yeltsin’s father, Nikolai Ignatevich, moved to work on a construction site in Kazan. Two years later Ignatevich was arrested as a “dekulakised kulak,” or someone allegedly retaining the kulak mentality, and sentenced to three years hard labor, a fact that Yeltsin kept secret until 1994. The family moved to Berezniki in the Perm region to work on the construction of a giant potassium processing plant. The hard conditions worsened following Russia’s entry into World War II in 1941, but the young Boris thrived at school, taking up numerous sports and excelling at volleyball.

In 1949 at the age of 18, Yeltsin became a student in the civil engineering department of the Urals Polytechnical Institute in Sverdlovsk, the city he made his home for the next 36 years. He divided his time between intense bouts of study and sporting activities, travelling the country as captain of the volleyball team. He met his future wife, Naina Girina from Orenburg, at this time. Yeltsin graduated in June 1955, and then gained practical experience on a building site. He was a hard but fair task master, imposing enormous demands on himself and fellow workers. In 1957, newly married, Yeltsin took charge of the construction of the Sverdlovsk Textile Kombinat, a major project that he completed on time. In 1959 Yeltsin joined the Communist Party of the Soviet Union (CPSU), but only in 1966 did he leave active civil engineering to head the Construction Department of the Regional Party Committee (Obkom, the acronym of the Oblast [Regional] Committee of the Communist Party). Yeltsin refused many of the perks that went with the job, but he was driven by his characteristic “obsessive ambition.”

In November 1976 Yeltsin made it to the top, becoming Obkom First Secretary over a region with a population of nearly five million, covering an area the size of England. He was an innovative and demanding leader, but never strayed from Party orthodoxy. At the Twenty-Sixth Party Congress in March 1981 Yeltsin was elected a member of the Central Committee (CC).

In March 1985 Mikhail Gorbachev came to power committed to reform. In April 1985 Gorbachev brought Yeltsin to Moscow as head of the CC’s Construction Department. In December of that year Yeltsin was appointed head of the Moscow Party Organization and with it, shortly afterwards, candidate membership of the Politburo, the Communist Party’s highest body. Yeltsin ran Moscow in a confrontational manner, firing those whom he considered resistant to change, but his talk of “social justice” and condemnation of elite privileges and corruption won him enormous popularity.
Yield

At the CC plenum of October 21, 1987, Yeltsin criticized the slowness of reforms and Gorbachev personally, and announced that he would resign from the Politburo. Facing a barrage of condemnation, Yeltsin was removed from leadership of the Moscow Party but was appointed head of the state construction agency, Gosstroiz. Cast out of the political establishment, Yeltsin placed himself at the head of the anti-Soviet revolution. He skillfully exploited the new democratic opportunities, being elected by acclaim in March 1990 a deputy from Moscow to the new Russian Congress of People’s Deputies (CPD). On May 29th, he narrowly defeated orthodox contenders to become chair of the new Russian parliament. He sponsored Russia’s declaration of state sovereignty on June 12, 1990, signaling the end of the Soviet Union and of Gorbachev’s attempts to reform communism from within. Elected Russia’s first president on June 12, 1991, Yeltsin exploited his democratic legitimacy to defeat the attempted hard-line coup of August 18 to 21, 1991. A meeting of the presidents of Ukraine, Belarus, and Russia near Minsk on December 8, 1991, announced the disintegration of the Union of Soviet Socialist Republics. Russia was now independent, and Yeltsin its leader.

Yeltsin’s impetuous and determined character stamped the new state. Throughout his leadership he maintained committed to market-oriented liberal, democratic, and Westernizing policies, although the way these policies were implemented was often at odds with the goal. In Yeltsin’s typical campaigning style, economic “shock therapy” was launched in January 1992, allowing the liberalization of prices. His failure to build consensus with parliament led to a breakdown in relations that ended with the forced dissolution in September and violence in October 1993.

The new constitution of December 12, 1993, provided for a strong presidency with weak oversight powers by parliament and the courts. Yeltsin used his powers to drive through market reforms, including a crash privatization program that allowed a few to become very rich (the so-called oligarchs), while the mass of the population became much poorer. Yeltsin’s decision to invade the breakaway republic of Chechnya in December 1994 caused untold suffering, and contravened several articles of the constitution. In federal relations, Yeltsin encouraged the development of segmented regionalism whereby regional leaders were able to enjoy an enormous devolution of authority as long as they remained loyal to him personally. Only by allying with the oligarchs was Yeltsin able to win a second term in 1996, but at the price of mortgaging the state to big business. The fall in oil prices precipitated the partial default of August 1998, provoked by the failure to collect enough taxes to service the growing budget deficit. On December 31, 1999, Yeltsin transferred power to his hand-picked successor, Vladimir Putin. He entered political retirement, offering critical support for the new president. Yeltsin left Russia a democratic, federal, market-oriented society, but all of these were deeply flawed in their operation. Yeltsin laid the foundations for a free society, but it would be up to his successors to build on what he had started.

YIELD

In economics and finance the word yield is used to describe the interest rate on a bond. In fact, the words yield and interest rate are used interchangeably and mean the same thing. There are several ways of calculating interest rates, with the most important being the yield to maturity, also known in many contexts as the internal rate of return. Economists consider the yield to maturity as the most accurate measure of the interest rate, and this is what they have in mind when they talk about interest rates.

The yield to maturity is the interest rate that equates the present value of payments received from a debt instrument with its cost (its value today). As an example, consider a simple, one-year loan. Assuming that you borrowed $1,000 for a year and you are required to repay the principal of $1,000 one year from now along with an interest payment of $100, then (according to the definition) the yield to maturity is given by
where $1,000 is the value of the loan today and $(1,000 + 100)/(1 + i)$ is the present value of the payments received from this instrument. Solving equation (1) for $i$ yields $i = 0.10$ (or 10%). In this case, the yield to maturity is the same as the simple interest rate, the latter being calculated as the ratio of the interest payment to the principal, $100/1,000$.

Although for simple loans, the yield to maturity equals the simple interest rate, this is not the case for other debt instruments. To calculate the yield to maturity on an $n$-year coupon bond with market price $P$, coupon payment $C$, and face value $F$, the following formula is used (see Mishkin and Serletis 2007, Chapter 4, for more details):

$$P = \frac{C}{1 + i} + \frac{C}{(1 + i)^2} + \cdots + \frac{C}{(1 + i)^n} + \frac{F}{(1 + i)^n}.$$  

(2)

If $P$, $C$, $F$, and $n$ are all known, then the above equation could be solved for the yield to maturity on the $n$-year bond (also known as the $n$-year interest rate), $i$. It should be noted that the yield to maturity is different from the coupon rate of interest, the latter being the ratio of the yearly coupon payment to the bond's face value, $C/F$. In fact, when the coupon bond sells at its face value ($P = F$), the yield to maturity is the same as the coupon rate; when the bond sells at a discount from face value ($P < F$), the yield to maturity is greater than the coupon rate; and when the bond sells at a premium from face value ($P > F$), the yield to maturity is less than the coupon rate. Equation (2) also shows that the yield to maturity and the price of a coupon bond are negatively related; when the yield to maturity increases, the price of the coupon bond falls, and when the yield to maturity falls, the price of the coupon bond rises.

As already noted, the yield to maturity can be calculated by solving equation (2) for $i$, if $P$, $C$, $F$, and $n$ are known. But this equation is difficult to solve algebraically, especially for high values of $n$. However, the same answer can be obtained using a financial calculator. Consider, for example, an eight-year, 10 percent coupon bond, with a face value of $1,000, selling for $900. Set a Texas Instruments BA-35 solar calculator in FIN mode by pressing the MODE key until the word FIN appears on the screen, and clear it by pushing the 2nd key and then the CE/C key. To find the yield to maturity:

1. Enter 900 and push the PV key.
2. Enter 1000 and push the FV key.
3. Enter 8 and push the N key.
4. Enter 100 and push the PMT key.
5. Push the CPT key and then the %i key.

The answer is 12.01 (or 12.01%).

Because of difficulties in calculating the yield to maturity, other less accurate measures of the interest rate have also come into common use in economic and finance. Two such measures are the current yield and the yield on a discount basis. The current yield is calculated as the ratio of the bond's yearly coupon payment, $C$, to the bond's current market price, $P$. That is,

$$\text{Current yield} = \frac{C}{P}.$$  

The current yield is the best approximation to the yield to maturity for coupon bonds, and changes in the current yield always signal changes in the same direction for the yield to maturity.

In the case of discount bonds, the interest rate is usually quoted as a yield on a discount basis. Discount bonds are bonds that sell at a discount from face value and involve no periodic coupon payments (this is why they are also known as zero-coupon bonds). Treasury bills and long-term zero-coupon bonds are examples of discount bonds. Consider, for example, a ninety-day Treasury bill with a face value $F$ selling at a price $P$. The yield on a discount basis (also known as discount yield) is usually calculated as follows:

$$\text{Discount yield} = \frac{F - P}{F} \times \frac{\text{Days in year}}{\text{Days to maturity}}.$$  

A related concept is the yield curve. The yield curve, published in the financial pages of most newspapers, shows the yield to maturity, $i$, as a function of the term to maturity, $n$. When the yield curve is upward sloping (the most typical case), the yield to maturity on long-term bonds (or, equivalently, the long-term interest rate) is greater than the yield to maturity on short-term bonds (the short-term interest rate); when the yield curve is downward sloping (referred to as an inverted yield curve), the spread between long- and short-term interest rates is negative; and when the yield curve is flat, short- and long-term interest rates are the same.

Early investigations into the yield curve looked at whether the slope of the yield curve can help predict future short-term interest rates and the level of economic activity. It was found that the yield curve does not always help predict future short-term interest rates—see, for example, Shiller, Campbell, and Schoenholtz (1983) and Mankiw and Summers (1984). More recent research based on better testing procedures, however, supports the view that the slope of the yield curve contains useful information about future interest rates over the short run and the long run, but not over the intermediate term—see, for
example, Fama (1984) and Campbell and Shiller (1991). Moreover, research over the past twenty-five years has documented a relationship between the slope of the yield curve and the overall level of economic activity; it has been shown that the slope of the yield curve is a good predictor of future economic activity. More recently, Estrella and Trubin (2006) offer practical guidance regarding the use of the yield curve as a forecasting tool in real time.

**BIBLIOGRAPHY**

**YIELD CURVE**

The yield curve is a graph depicting the relationship between yield and the length of time to maturity for debt securities with comparable degrees of risk. The horizontal scale measures years to maturity, while the vertical axis presents yield to maturity. This relationship is also called the term structure of interest rates.

The shape of the yield curve plays a critical role in the decisions of individuals and corporations, and in the conduct of monetary policy by central banks, such as the U.S. Federal Reserve Bank. Individuals choosing between an adjustable and fixed-rate mortgage, and corporations deciding whether to issue short- or long-term debt, can make sensible decisions only if they understand the factors that shape the yield curve. Central banks, which operate in the short-term market, need to understand the likely effect of their activities on long rates.

Generally, the yield curve approximates one of three shapes. The curve may display the lowest yields on short-term issues, then rise and become relatively flat in the longest maturities, forming an ascending curve. Alternatively, yields may be highest on short-term securities, forming a descending (or inverted) curve. Sometimes, yields are the same for all maturities. Three economic theories—the expectations, liquidity-preference, and institutional or hedging pressure theories—explain the shape of the yield curve.

**THE EXPECTATIONS THEORY**

For expectations theorists, the shape of the yield curve is a reflection of investors’ anticipations of future interest rates. Suppose that lower rates are likely in the future. Long-term bonds will appear more attractive than short-term ones if both maturities sell at equal yields. Long-term bonds allow an investor to earn a relatively high rate for a longer time period than shorter issues permit. Short-term bond investors risk having to reinvest their funds later at lower yields. Also, since bond prices move inversely to interest rates, buyers of long-term bonds realize capital appreciation if yields decline.

If investors act in accordance with these expectations, they will tend to bid up prices (force down the yields) of long-term bonds and sell short-term securities, causing their prices to fall (yields to rise). These operations will produce a descending yield curve with short-term issues yielding more than long-term bonds. Similarly, the expectations theory predicts the yield curve will be upward-sloping when investors expect interest rates to rise. The yield curve will be flat when no change is expected in rates.

**THE LIQUIDITY-PREFERENCE THEORY**

The liquidity-preference theory agrees that expectations are important but argues that short-term issues are more liquid and thus inherently more desirable to investors than longer-term bonds. Short-term issues can be converted into cash on short notice without appreciable loss in principal. Long-term issues tend to fluctuate in price with unanticipated changes in interest rates and hence ought to yield more than shorts by the amount of a risk premium.

If no premium were offered for holding long-term bonds, most individuals and institutions would prefer to hold short-term issues. Borrowers, however, prefer to issue long-term debt to assure themselves of a steady source of funds. This leaves an imbalance in the pattern of supply
and demand for the different maturities. Thus, even if interest rates are expected to remain unchanged, the yield curve should be upward-sloping, since the yields of long-term bonds will be augmented by risk premiums necessary to induce investors to hold them. The "normal relationship" is assumed to be an ascending yield curve.

THE INSTITUTIONAL OR HEDGING-PRESSURE THEORY
Liquidity is critical for some investors, but not for others. Commercial banks care about liquidity and prefer short-term issues, but liquidity is not important for life insurance companies and pension funds, which typically hedge against risk by purchasing long maturities.

That is precisely the thrust of the hedging-pressure argument. Different groups of investors have different maturity needs that lead them to concentrate their security purchases in restricted segments of the maturity spectrum. Flows of funds to particular investors, as well as changes in those preferences, will then influence the curve independent of expectations. So will the preference of international investors recycling Petro and Sino dollars. In 2005 foreigners invested over $350 billion in U.S. Treasury bonds while they were net sellers of Treasury bills, depressing the yields of long-term U.S. bonds.

EMPIRICAL STUDIES OF THE YIELD CURVE
Empirical studies of the yield curve suggest that all three theories have an influence on the shape of the yield curve. Expectations of future rates are important, but so are liquidity and institutional considerations. The average shape of the yield curve is ascending, suggesting that holders of long-term bonds do earn (il)liquidity premiums. The yield curve also appears to be a predictor of future economic activity. Inverted yield curves, while not invariably followed by a recession, have preceded all recessions experienced in the United States during the last forty years. Such a signal is consistent with the logic of the expectations theory. An inverted curve suggests that investors expect lower future rates. Recessions usually lower rates by lowering business loan demand and encouraging expansionary monetary policy.

YOUTH CULTURE
The term youth culture is used generally in reference to the ways adolescents set themselves apart from the adult culture. Although age-based cultural differences have existed since the beginnings of recorded history, it was only in the 1950s, after the crystallization of “teenagers” as distinct social personae with their own music, lifestyles, fads, and characteristic slang, that the concept of a “youth culture” as separate from adult culture materialized in North American and European society. Before then anyone reaching the age of puberty was expected to conform to the norms of the larger adult culture.

The emergence of an autonomous youth culture was heralded in fictional form by the American novelist J. D. Salinger (1919–) in his still popular and controversial novel The Catcher in the Rye, published in 1951. Salinger provided the first portrait of the new teenage persona—a portrait that was shortly thereafter enshrined in all kinds of media (magazines, songs, television programs, and movies), taking on a social life of its own. Since the mid-1950s youth culture has evolved independently and primarily through lifestyle designations associated primarily with youth-generated musical trends and styles (rock and roll, disco, punk, and rap). This is why cultural historians tend to characterize the evolving forms of youth culture with terms such as the hippie era, the disco era, the punk era, and the hip-hop era. Each era is in fact marked by its own pattern of symbolism, ritual, slang, and overall lifestyle (clothing and body decorations) derived from attendant musical styles.

The study of youth culture in the social and human sciences has become a major academic enterprise since the 1960s. Three major cultural theories have come forth relating specifically to youth, as separate from the psychology of adolescence. One of these posits that any youth trend is perceived initially by the adult culture as subversive or transgressive, constituting a sign of impending apocalyptic danger or threatening societal values, but which gradually dissipates and blends into the larger cultural mainstream. Known as “moral panic theory,” the concept was proposed by Stanley Cohen (1972) in his
insightful study of mods and rockers in the mid-1960s. An early twenty-first century crystallization of moral panic surfaced as a result of the trend of many youths to "network socially" on the Internet at sites such as MySpace and Friendster.

Another main theory is that youth culture has become the default form of all North American and European culture, spreading throughout the social landscape independently of age. As the social critic Thomas Frank (1997) has skillfully argued, youth has become a social and economic commodity since the 1960s. Because youth sells, trends in the adolescent world quickly become the cultural norm, dictating look, taste in music, and fashion.

A third major theory of youth culture is that it constitutes a form of carnivalesque theater in which the sacred, perceived to be anything authoritative, rigid, or serious, is "profaned" or mocked simply for the sake of it. This theory has been inspired by the work of the social critic Mikhail Bakhtin (1986). It would explain why, for example, emerging youth forms of culture seem to fly in the face of the adult official “sacred world” while at the same time not posing any serious subversive political challenge to it.

YUGOSLAVIAN CIVIL WAR
The civil wars in Yugoslavia after 1991 involved the most severe violence in Europe since the Greek civil war (1946–1949), generating almost 70,000 battle-deaths and displacing many refugees. Many claimed that the cold war had contained nationalism in Europe, and that its end would unleash a wave of sectarian conflict. Paradoxically, this failed to materialize in most socialist states except for Yugoslavia, where the Soviet Union had only minimal direct influence, previously considered a relatively successful case of multi-ethnic political integration.

The Federal Republic of Yugoslavia was torn apart by demands for autonomy from the relatively more prosperous republics of Slovenia and Croatia and the increasing assertiveness of Serbia under Slobodan Milošević (1941–2006). Slovenia’s declaration of independence in June 1991 led to a minor violent confrontation with the Yugoslav National Army (JNA) but was quickly settled. Whereas independence was relatively uncontroversial for the ethnically homogenous Slovenia with undisputed borders, Croatia was much more contentious due to its large Serb population. The increasingly Serb-dominated JNA seized control over much of Croatia, and violent conflict escalated with the siege of Vukovar in August-November 1991. A January 1992 United Nations’ (UN) peace plan brought combat to an end but perpetuated Serb control over much of Croatia. Later that year violence erupted between Croats, Serbs, and the Muslim dominated central government in Bosnia, leading to a protracted war with many atrocities. An International Criminal Tribunal (ICT) was set up in 1993 to investigate allegations of war crimes in the former Yugoslavia. Although fighting in Bosnia formally was carried out by autonomous militias, the Milošević and Franjo Tudman governments of Serbia and Croatia are believed to have provided extensive support, and the ICT has brought charges against official representatives of both.

The inability of the UN to contain the conflict in Bosnia led NATO and the United States to take a more active role in 1994. The United States brokered a settlement agreement between the Bosnian Croats and the central government and provided military assistance to Croatia. In a military offensive in mid-1995, Croatia reconquered most of the Serb-held areas, and NATO bombardment forced the Serbs to sign the Dayton peace agreement in late 1995. The growing inability of Milošević to control events outside Serbia proper in turn
promoted violence among the Albanian majority in the formerly autonomous Kosovo province. The main Albanian opposition leader Ibrahim Rugova (1944–2006) had advocated a strategy of nonviolent resistance, which had succeeded in keeping Kosovo quiet but brought few Serb concessions and did not prevent extensive repression.

Following an influx of arms during the chaos in Albania in 1997, the Kosovo Liberation Army (KLA) turned to violent confrontation. Although the KLA was militarily much weaker than the JNA and the immediate Serb response was increased repression, the escalating violence, with a large outflow of refugees and allegations of atrocities, prompted NATO to start bombing Serbia in March 1999. Faced with prospects of a ground invasion, Milošević agreed to NATO demands in June, and a UN protectorate was established in Kosovo. Although Milošević had survived previous mass demonstrations calling for his resignation in 1991 and 1996, he was finally forced to leave in October 2000 after attempts to dispute an opposition electoral victory, and Serbia has not engaged in conflict with its neighbors since his ouster. The perceived success of the KLA inspired an Albanian armed uprising in Macedonia in 2001, but outside involvement prevented the conflict from escalating.

ZAPATA, EMILIANO
1879–1919

Leader of the Mexican Revolution of the early twentieth century, Emiliano Zapata was born on August 8, 1879, in Anencuilco in the southern state of Morelos and died in an ambush on April 10, 1919. Zapata was the revolution's leading advocate of agrarian issues and one of Mexico's most renowned and mythological heroes. The iconic image of Zapata dressed in a broad sombrero with a black mustache and cartridge belts across his chest appears commonly across Mexico. Contemporaries and subsequent scholars have alternatively interpreted Zapata as a bandit or a social revolutionary. The division between rural supporters who viewed Zapata as their champion and urban dwellers who denounced him as the Attila of the South points to persistent social divisions that run through the country.

The Zapata family had long been privileged leaders of their community, but under the dictatorship of Porfirio Díaz they had begun to lose their lands and their class status eroded. Recognizing Zapata's organizing skills, his community elected him to a leadership position in 1909. When legal negotiations for land titles with landowners collapsed, Zapata led community members to occupy haciendas. He had become an armed revolutionary, and his followers were known as Zapatistas.

Zapata initially joined forces with Francisco Madero, who launched a revolution against Díaz in 1910. When Madero disposed the dictator in 1911, Zapata asked the new president to return communal lands. Madero, however, insisted on following institutional procedures and demanded that Zapata's Liberation Army of the South disarm. Zapata refused, arguing that they could gain their goals only through the pressure of armed force. This led Zapata to break from Madero and demand more radical reforms. On November 25, 1911, Zapata issued his Plan of Ayala (named after his local municipality), which denounced Madero as a tyrant and dictator worse than Díaz unwilling to make the necessary deep-seated changes that the revolutionaries demanded. Zapata called for a continued revolution to overthrow Madero.

The Plan of Ayala's most important thrust was a demand for agrarian reform, including a return of communal lands and expropriation of hacienda lands—without payment if the owners refused to accept the plan. The plan led to Zapata's most famous slogan “Tierra y Libertad” (Land and Liberty), which was borrowed from and reflected the ideological influence of the anarchist Ricardo Flores Magón. Over the next decade the plan became the guiding principle for Zapata's forces.

In February 1913, when General Victoriano Huerta assassinated Madero in a military coup, Zapata allied with Venustiano Carranza's Constitutionalist Army to defeat the new dictator. After Huerta's disposal, Zapata unified forces with Pancho Villa at a convention in Aguascalientes to continue the battle against the more moderate Carranza. Together, Zapata and Villa occupied Mexico City. Zapata, however, was more interested in local issues in Morelos than governing the country. His alliance with Villa quickly broke down, and Carranza recaptured the capital. Carranza convoked a constitutional assembly that elected him president. Even though he did not invite Zapata to the assembly, the latter's Plan of Ayala influenced Article 27 of the progressive 1917 constitution that codified an agrarian reform program. No significant dis-
Zapatistas

tribution of land occurred, however, until Lázaro Cárdenas’s populist government in the 1930s.

Zapata fought on despite overwhelming odds. With his prospects for victory declining and desperately short of weapons, Zapata was lured into an ambush on April 10, 1919, at the Chinameca hacienda in Morelos. Revealing their fear of Zapata’s leadership and symbolism, government troops riddled his body with bullets and then dumped his corpse in Cuautla’s town square. Supporters refused to accept Zapata’s death, claiming that someone else had taken his place and that he had escaped to the mountains. With Zapata gone, the Liberation Army of the South began to fall apart.

After his martyrdom Zapata was incorporated into the pantheon of Mexican revolutionary leaders, even though he most certainly would oppose the policies of many subsequent political leaders. Although over the years Zapata’s name was invoked for a variety of political causes, his name and image gained renewed interest in 1994 with the Zapatista Army of National Liberation (EZLN) uprising in Chiapas. Although Chiapas was isolated from the Mexican Revolution and Zapata never organized in that area, the neo-Zapatistas fought for many of the same issues that their namesake had almost a century earlier. Paralleling the situation in Morelos, indigenous communities in Chiapas had lost their lands to large landowners and faced a corrupt and repressive regime with a political stranglehold on local communities. Zapata’s slogan “Land and Liberty” summarized their ongoing struggle and pointed to how few of Zapata’s dreams had been realized.

Z-D MODEL

The Z-D model refers to the analysis contained in chapter 3, “The Principle of Effective Demand,” of John Maynard Keynes’s The General Theory of Employment, Interest, and Money (1936). It was in this early chapter that Keynes first unveiled what he considered a revolutionary new approach, defining the range of possible levels of employment that could (and in the West in the 1930s, did) characterize a market economy in equilibrium. At this early stage of his book, his task was to outline the path his argument was to take. He used what has since become known as the Z-D model to accomplish this task.

Keynes’s model is based on the expectations of producers and demanders as to how much employment-generating aggregate activity they can profitably either engage in (the producers) or purchase the output of (the demanders) in the short period. The short period is defined by the time necessary to realize the results of the aggregate of producers’ decisions (whether these were maximally profitable or not) for demand and supply. Crucially, demand for consumer goods can be known within this period, but the demand for investment goods cannot, since the value of such goods to demanders depends on an expectation of return over a longer time horizon than just the short period. In practice, this reduced to the assumption that the following are fixed: (1) the existing level of technology; (2) capital and labor; (3) the existing propensity to consume or save out of income; and (4) the expectations of the return on newly produced investment (what Keynes termed long-period expectations).

With this in mind, we can understand Keynes’s basis for declaring—as he did many times after the General Theory was published—that his theory of short-period employment is most easily understood under the assumption that short-period expectations are always fulfilled; that is, given their assumptions, producers’ output is the profit-maximizing one for each of them in this situation. Notice this leaves the state of long-term expectations, and so the level of investment, as given, and not necessarily at the level required for full employment.

A Z or aggregate supply function is then posited to capture producers’ short-period expectations as to what level of production and employment will be profitable, given the relevant ceteris paribus conditions (above) and their expectations of demand (which can be assumed to be correct in equilibrium). Thus Z is a function of the proceeds producers expect, given the costs of producing a level of output. Hence: Let Z be the aggregate supply price of the output from employing N men, the relationship between Z and N being written \( Z = \Phi(N) \), which can be called the aggregate supply function (Keynes 1936, p. 23).

Similarly, a D or aggregate demand function is posited to represent the sectoral demands, namely, the consump-
tion function for goods and services by households (later in the chapter, $D_1$), and the demand for newly produced capital by investors ($D_2$). Hence: Similarly, let $D$ be the proceeds that entrepreneurs expect to receive from the employment of $N$ men, the relationship between $D$ and $N$ being written $D = f(N)$, which can be called the aggregate demand function (Keynes 1936, p. 23).

Due to diminishing returns to employment, $N$, in the short period, we may expect the supply function, $\Phi(N)$, to rise at an increasing rate in $N$. We also expect $D_1$ to rise at a constant and eventually less-steep rate than $\Phi(N)$ as $N$ increases (with growing output) because the household marginal propensity to consume ($\chi$) is less than one (or, amounting to the same thing, the marginal propensity to save out of increased income is positive); and that $D_2$ is fixed by long-term expectations as to the amount a community is currently willing to spend on investment. Thus, where the increasingly rising $Z$ function intersects a constantly rising total $D$ function, employment will be determined.

This is the point of expected profit maximization. To the left of the intersection, producers can expect to make increased profits by employing more workers; to the right, the expected proceeds do not justify the additional expected cost.

“Hence the volume of employment in equilibrium depends on (i) the aggregate supply function, $\Phi$, (ii) the propensity to consume, $\chi$, and (iii) the volume of investment, $D_2$. This is the essence of the General Theory of Employment” (Keynes 1936, p. 29).

Thus does Keynes stake out his question. Those factors that determine the marginal propensity to consume and the volume of investment become the keys to what level of employment a market economy will generate in short-period equilibrium (i.e., the time frame in which we live).

**ZERO POPULATION GROWTH**

The term *zero population growth* encompasses both an urgent call to reduce the number of human beings and a neutral description of anticipated future demographic conditions. In either case, social scientists have not debated whether the world will reach zero population growth but when, at what level, and with what costs or benefits along the way.

Population growth has periodically preoccupied theorists since ancient times, but fears of overpopulation emerged in earnest in response to the unprecedented demographic expansion that accompanied the post-1650 global agricultural revolution. (From 50 million in 1000 BCE, the earth’s population increased slowly to 545 million in the year 1650, and then more than doubled to 1.2 bil-
lion in 1850 [Kremer 1990, p. 683]). At the turn of the nineteenth century, the British economist and pastor Thomas Malthus (1766–1834) famously argued, “Population, when unchecked, increases only in a geometrical (exponential) ratio. Subsistence (the food supply) increases only in an arithmetical ratio” (Malthus [1798] 1959, p. 5). During much of the nineteenth century, leading European classical economists, especially John Stuart Mill (1806–1873), incorporated Malthusian precepts and argued that population growth leads to diminishing economic returns as poorer land is brought under cultivation and an excess of workers drives down wages. Yet Thomas Jefferson (1743–1846) and other American intellectuals dismissed the notion of a population-resources problem as inapplicable to their imagined wide-open and egalitarian nation.

THE MALTHUSIAN ERA
The closing of the American frontier, as declared by the U.S. Census Bureau in 1890, engendered a Malthusian revival (that is, calls for immediate zero population growth). Moreover, as immigration to the United States surged and a pseudoscience of race matured, the desire to limit total population growth became intimately related to anxiety among many elite, white Americans that native-born Americans were having fewer children than nonwhite immigrants. A trans-Atlantic eugenics movement sought to breed a better population by encouraging more births among the genetically “fit” and discouraging them among the “unfit.” The mixture of eugenics and Malthusianism contributed to the passage of restrictive immigration laws in the United States in the 1920s.

During the 1930s, Malthusian concerns abated. Birthrates in the industrialized world, in response to the Great Depression, continued to decline. For the first time, the prospect of zero population growth in the wealthy European and North American nations seemed a possibility. One group of economists, led by Great Britain’s John Maynard Keynes, overturned the classical economists on the matter of population growth; they argued that population growth spurs economic progress by creating more consumers and economies of scale. Many economists and demographers, however, disagreed. They continued to espouse the traditional view that a smaller population would be good for the economy; in their view, the economy could grow through higher consumption per person rather than through a sheer increase in numbers.

After World War II (1939–1945), overpopulation concerns reemerged. A few social scientists and policymakers suggested that the war had been caused by population-resource pressures in the Axis nations. Many more became alarmed by the skyrocketing rates of population growth in the developing or Third World, which resulted from better hygiene and public health, and by the baby boom in the United States and other wealthy nations (from 1945 to 1964). Two best-selling books of 1948, Fairfield Osborn’s This Plundered Planet and William Vogt’s Road to Survival, briefly generated a revival of radical Malthusian ideas.

The postwar Malthusian resurgence was undercut somewhat by optimism that modern science would alleviate resource scarcity by better extracting natural resources and even creating new ones from scratch. In particular, atomic power and the Green Revolution in agriculture (the higher yields produced by crop breeding and pesticides) promised nearly unlimited energy and food supplies. In addition, while many postwar intellectuals concluded that population growth in the developed world caused aesthetic problems (e.g., more garbage and less parkland) as well as cultural concerns (e.g., more conformity and less privacy), they doubted whether it engendered true resource scarcity.

Still, in the 1950s and early 1960s, most social scientists continued to espouse a moderate anti-population-growth position, if not the strident Malthusians’s goal of a rapid transformation to zero population growth. The dominant paradigm within the demography profession was demographic transition theory. This was the idea that industrialization and economic development first drive population increase because medical and sanitary improvements lower mortality well before cultural norms of (copious) childbearing shift. In the next stage, however, birthrates drop in response to the new gender and economic arrangements that accompany modernization. Eventually, population decreases. Demographers concluded, however, that waiting for modernization to run its course was not sufficient; population expanded too rapidly in the early stages and the resulting poverty actually blocked the further progress of modernization. They reached a consensus that direct intervention (e.g., family planning aid) was needed to induce the transition to lower birthrates. In a seminal 1958 study of India, two American economists, Ansley Coale and Edgar Hoover, predicted that lower birthrates would substantially increase incomes in that nation. The Coale-Hoover thesis informed efforts to invest in family planning programs for the developing world. In the 1950s, the American philanthropic sector (especially the Population Council, founded by John D. Rockefeller III [1906–1978] in 1952) took the lead in promoting such programs and fostering population-related research.

THE ZERO POPULATION GROWTH MOVEMENT PEAKS
The United States government did not articulate an official anti-population-growth policy, but it did incorporate
population-resource concerns into cold war geopolitical strategies. The idea that population growth generated conditions conducive to communism was fundamental to the development of foreign aid programs to the Third World as well as diplomatic efforts to promote international resource conservation. In the mid-1960s, the U.S. government began providing direct technical assistance and grants for family planning programs overseas and at home.

By the late 1960s, the peak of the annual global population growth rate (about 2.1 percent from 1965 to 1970; Cohen 1995, p. 54), famine in Africa, and burgeoning mass environmentalism propelled an organized zero population growth movement, the high-water mark of postwar Malthusianism. The fear now was that population growth—in both the developing and developed worlds—would ruin the world’s ecological systems, not merely threaten the food supply. In 1969, the American biologist Paul Ehrlich (b. 1932), author of The Population Bomb (1968), spearheaded the creation of the group Zero Population Growth. This organization created widespread awareness of the putative population problem and generated significant publicity. The Limits to Growth, a widely debated 1972 study by a team of Massachusetts Institute of Technology (MIT) researchers, used a crude algorithm of resources, pollution, and population to predict the collapse of the world system in 100 years. Most proponents of zero population growth primarily emphasized education and the need for voluntary reductions in fertility (and to a lesser degree, promoted public policies such as the elimination of tax benefits for families and the legalization of abortion rights). A small but vocal minority, however, reduced the staying power of the population movement by calling for such radical measures as involuntary sterilizations of women after they had given birth to a certain number of children.

As the 1970s began, the U.S. government briefly accelerated its engagement with the population question beyond the question of funding for contraception, but ultimately abandoned the issue all together. President Richard Nixon offered a special message to Congress endorsing a gradual transition to zero population growth. In 1972, after meeting for two years, the Commission on Population Growth and the American Future, chaired by Rockefeller, called for several moderate measures to hasten the arrival of zero population growth in the United States. Nixon, however, immediately distanced himself from the commission’s final report, and in particular its call for abortion rights (the Supreme Court would not decide the epochal case of Roe v. Wade until January 1973). Personally opposed to abortion, the president was also embracing a political strategy of appealing to Catholic and culturally conservative voters.

Wider forces than presidential politics ensured the rapid demise of the zero population growth movement. Ascendant conservatives, led by Julian Simon, celebrated the purported economic and cultural benefits of steady population growth (1990). In addition, the birthrate decreased noticeably in the early 1970s, which took some of the sting out of the zero population growth movement’s critique. Many opponents of the zero population growth movement accused it—unfairly, for the most part—of seeking to primarily regulate the fertility of racial minorities. Other critics insisted that blaming population growth for environmental and social ills was a copout compared to attributing primacy to technology run amok and the inequalities of capitalism.

TOWARD ZERO POPULATION GROWTH

By the late 1970s, the Malthusian moment had passed in the United States. Domestic and overseas family planning policies had become institutionalized, but policymakers no longer seriously considered intervening to reduce the birthrate. The environmental movement largely abandoned its support for zero population growth due to an anti-immigration stigma increasingly attached to this position. China’s adoption in 1979 of a one-child policy, which engendered myriad human rights violations (even though in many locales, especially the cities, the policy merely codified existing trends), further increased the stigma surrounding population policy. At the 1984 World Population Conference, the U.S. delegation famously declared that population growth was a neutral phenomenon. In the early twenty-first century a few Malthusians around the world continue to argue that population growth, especially in wealthy, high-consumption nations, is a major cause of global warming and will eventually have ruinous consequences for the worldwide standard of living and the environment. Some economists continue to argue that the transition to lower fertility leads to a demographic dividend for developing nations. But demands that world leaders act to slow down population growth are few and far between.

The United States has become something of a demographic outlier. Currently, the global population increases by about 80 million, or 1.2 percent, per year, but developing nations account for virtually all of that growth (World Population Prospects: The 2006 Revision 2007). Many industrialized nations such as Japan and Italy are heading toward zero population growth and should actually be in decline in fifty years. In contrast, in the United States, high levels of immigration and relatively high birthrates among immigrants and the U.S.-born alike have put the nation of 304 million (in 2007) on a path toward 570 million in 2100, according to the U.S. Census Bureau’s
middle-range projections (Methodology and Assumptions for the Population Projections of the United States: 1999 to 2100 2000). Some experts fear the possible geopolitical consequences of this demographic trajectory, such as a further dependence on foreign oil. But most experts celebrate the supposed economic benefits of steady population growth. Perhaps the greatest demographic fear in the United States is of an aging crisis. That is, many social scientists worry that Americans are not having enough babies (future workers) to pay the imminent Social Security bill of the baby boom generation.

Assuming that fertility declines continue on their present course, the United Nations Population Division predicts the earth’s population will reach 9.2 billion in 2050 (from nearly 7 billion in 2007) and then crest soon thereafter (World Population Prospects: The 2006 Revision 2007). Since the 1970s, the zero population growth movement has faded into near irrelevancy, but if early twenty-first-century trends hold, zero population growth will nonetheless be achieved in the not-too-distant future.

ZERO-SUM GAME
“Zero-sum game” describes a situation in which two “players” with strictly opposed interests each make a decision that results in one player’s winning equaling the opposing player’s loss. Many recreational games, such as chess, poker, and tic-tac-toe, are zero-sum because for one player to win, the opposing player(s) must lose.

The notion of zero-sum games originated in a branch of applied mathematics known as game theory, which has enjoyed extensive application in the social sciences. John von Neumann (1903–1957), a mathematician, is usually credited with creating game theory, and he first explicated the theory of zero-sum games in his seminal work with Oskar Morgenstern, Theory of Games and Economic Behavior (1944). Game theory is essentially a study of conflict situations between two or more opponents or players. Each player in the game situation must decide on a course of action, or strategy, and the strategy each player chooses affects the outcome for all players in the game. The outcome, or solution, to a zero-sum game specifies how each player should move, and if each player moves accordingly, then the resulting payoff is known as the value of the game (Kelly 2003).

The easiest class of games to analyze is two-person zero-sum games, and these games typically receive the most scholarly attention among those who study zero-sum games. In Theory of Games, von Neumann and Morgenstern focus their attention on two-person zero-sum
games and show that in this type of game situation there always exists a solution that allows each player to avoid the worst possible outcome. To arrive at this solution, both players base their course of action on what they expect their opponent's action will probably be. Keeping their opponent's likely course of action in mind, both players attempt to minimize the opponent's maximum payoff, thereby maximizing their own minimum payoff. In doing so, the outcome of the game ends up being that both players obtain the best payoff they possibly can, given the nature of the game, and neither is able to do any better. This outcome is known as the equilibrium of the game, and this point can be thought of as the outcome in which neither player has any regrets about the course of action chosen. This method of play is known as the minimax theorem, and von Neumann and Morgenstern showed that all two-person zero-sum games have a minimax solution.

All zero-sum games can be classified as having either perfect information or imperfect information. In a game with perfect information, each player in the game is fully aware of all previous moves in the game, meaning that each player knows what actions the opponent has already taken. In tic-tac-toe, for example, after the "X" player's move, the "O" player knows exactly where the "X" player has placed an "X." In games of perfect information, there is always at least one optimal or best possible strategy for each player. However, the existence of a best possible strategy does not guarantee that a player will win or even be able to identify that strategy. Using the best possible strategy only guarantees that both players will minimize their losses, regardless of whether they win. But there may also be so many viable strategies to choose from that it becomes impossible to determine what the best strategy is.

When applying the minimax theorem to zero-sum games with perfect information, it is possible to achieve the equilibrium point, or the point that represents the outcome that results from both players using their best possible strategy, also known as the saddle point. All zero-sum games with perfect information have at least one saddle point, and the saddle points can be determined using the minimax theorem. However, on some occasions the minimax theorem does not necessarily have to be used to determine a game's saddle points. Occasionally, one player has strategies available that dominate the other strategies. A strategy is considered dominant if it yields a player a better outcome than any other strategy, despite the actions taken by the opponent. When a strategy is dominated by another, then the dominated strategy is said to be inadmissible because, if players are trying to get the best possible outcome, then it cannot make sense to choose a dominated strategy (Kelly 2003).

In games with imperfect information, the players are not fully aware of their opponent's prior moves. This means that each player must choose an action without knowing what action the opponent has taken or may be taking simultaneously. A simple example of this would be the game rock-paper-scissors. While there may not be one best possible strategy, it is still possible to find a minimax solution to two-person games of imperfect information. This solution can be obtained by using mixed strategies. Using a mixed strategy means that a player uses one strategy sometimes, another strategy at other times. The player assigns each strategy a particular probability of being used and chooses a strategy based on these probabilities. When mixed strategies are in equilibrium, meaning that neither player can do better by deviating from these strategies, the strategies are sometimes called minimax mixed strategies (Kelly 2003).

Analysis of zero-sum games has been applied to a variety of social science disciplines, but it has probably enjoyed most extensive application in the fields of economics and political science. In political science, for example, most elections can be thought of as zero-sum games given that for one candidate to win, the opposing candidate must lose. Also, when considering the distribution of political resources, some scholars believe that for one group to gain political resources, others must lose resources, thus implying a zero-sum nature to political competition. However, the application of zero-sum games to political and economic phenomena is necessarily limited given that most conflict situations are not zero-sum. In many conflict situations, competitors do not have strictly opposed interests; it is often possible for both players in a game to win, as sometimes is the case with economic competition, or for both players to lose, as can happen with pollution or arms races (McCain 2004). Because of the dearth of real-world zero-sum situations, and thus zero-sum's limited applicability, most game theoretic applications in the social sciences are not zero-sum.

ZIMBARDO, PHILIP
1933–

Few psychologists are as famous as Philip George Zimbardo. Zimbardo is known both for his flamboyant behavior (e.g., he is rumored to have worn a black cape decorated with a Z) and for his research, teaching, and promotion of psychology. His work has had a meaningful impact on the social sciences and the general public. Zimbardo received his PhD from Yale University in 1959. He became a professor at New York University in 1960 and in 1968 joined the faculty at Stanford University, where he remained until his retirement in 2003. This entry discusses just a few of Zimbardo’s important contributions.

Zimbardo obtained fame in 1971, when he conducted what has become known as the Stanford Prison Experiment (SPE). Zimbardo randomly assigned twenty-four normal college students to the roles of prison guard and prison inmate in a mock prison set up in the basement of the Stanford psychology building. The experiment was to last two weeks but was terminated after six days because some participants became the role they were assigned to play; some guards acted sadistically and aggressively toward inmates, whereas some inmates exhibited depressive-like symptoms, anxiety, and extreme anger. Zimbardo’s experiment led him to conclude that the behavior of guards and inmates in real prisons is created more by their roles than by their personalities.

Zimbardo’s SPE is a classic in psychology. It revealed the power that situations and roles can have in shaping behavior. Zimbardo frequently speaks on this topic and has even pointed out parallels between his experiment and the 2004 Abu Ghraib prison abuse scandal. Zimbardo’s experiment, however, is not without its critics. Some critics (including Zimbardo) contend that it was blatantly unethical because of the extreme stress placed on inmates, whereas other critics challenge the conclusions of the SPE because of its methodology (e.g., the data collection was limited; guards were given instructions on how to behave).

Although Zimbardo is most known for his SPE, he has contributed to psychology in other important ways. After the SPE, Zimbardo and colleagues embarked on a program to investigate debilitating shyness. His research led to over thirty publications on this topic alone and to the creation of a shyness clinic. Zimbardo is also an instrumental voice in promoting psychology to the general public. He has authored a popular introductory psychology textbook, Psychology and Life, that was in its eighteenth edition in 2007. In 1990 he narrated the PBS television series Discovering Psychology, which discussed almost every area of psychology in an understandable and engaging format. This series introduced many people for the first time to the fascinating world of psychology. Its 2001 updated edition is frequently used in high schools and universities. The possible highlight of Zimbardo’s career came in 2002, when he was elected president of the American Psychological Association, the largest worldwide association for psychologists with over 150,000 members.

Few psychologists are as well known as Zimbardo. The mere mention of his name to others in psychology might lead to stories of his flamboyant behavior or to an engaging discourse about the ethics and conclusions of the SPE. Regardless of what comes to mind when one thinks of Zimbardo, it is difficult to discount the positive impact his research, teaching, and promotion have had on psychology and society.

ZIONISM

Zionism is the modern movement whose goal is the restoration of the Jewish people to the region on the eastern shore of the Mediterranean commonly known (at least until the establishment of the Jewish State of Israel in 1948) as Palestine or Zion. Not all of its adherents have been Jews. It draws, however, on ancient motifs sustained in Jewish collective memory, religion, and culture (and to some extent in the Christian West more generally), relating the telos of world-historical redemption and the com-
ing of the Messiah to the restoration of the Jews to their ancient homeland and the building of the third, and eternal, holy Temple in Jerusalem. Since its inception in the nineteenth century, Zionism has been an ideologically multifaceted and internally contentious movement, and its fortunes have changed in complex relation with European anti-Semitism and with colonialism beyond Europe’s borders.

It is certainly difficult, and may be impossible, to present a summary account of Zionism, along with its bases of support and the sources of opposition to it, that is genuinely objective—not only because the movement continues to inspire intense passions, both positive and negative, but because its premises rest on accounts of history, geography, and nationality that are themselves fundamentally contested. Thus, Palestine refers to an ancient Roman province, to a British protectorate in the period of late European colonialism, and to the place claimed as a homeland by those residents of the region who have come to understand themselves as forming part of a non-Jewish, Palestinian nation. Speaking of the land as Zion reinforces the centrality of the region to Christian as well as Jewish sacred history and eschatological expectations. Even the notion that the Jewish people the world over constitute a single nation, central to Zionism and accepted as well by some competing Jewish movements prior to World War II (1939–1945), has not been universally accepted by Jews in the modern period.

ANCIENT AND MEDIEVAL ROOTS

Zionism draws on a rich and powerful repository of memorial resources preserved through Jewish generations, which profoundly inform ritual and expressions of religious yearning. Memorial literature that has been continuously studied since the destruction of the First and then the Second Temples in Jerusalem mourns their loss, enjoins their memory, and promises their restoration. The model of return from exile, as noble adventure and divinely sanctioned, is prefigured in the chronicles of the return from Babylonian exile led by Ezra and Nehemiah. Portions of the Babylonian Talmud detailing the correct procedures for fulfillment of commandments and strictures that relate only to times when the Jews live in Israel and the Temple stands continued to be studied, both in commemoration of the past and in anticipation of a redeemed future.

Nearly all this commemoration took place not only in the absence of Jewish sovereignty, but outside the land. At least since the destruction of the Second Temple in 70 CE, and continuing throughout the Christian era until the twentieth century, Jewish communities have been found overwhelmingly outside the imagined national homeland. This condition is itself subject to differing designations with various ideological implications. The Hebrew and Yiddish terms galut or goles, commonly translated as exile, stress the element of loss inherent in location outside the homeland. On the other hand, the scattered Jewish communities are also commonly described as being in diaspora, an ancient term originally applied to colonies of Greek settlers throughout the Mediterranean. A thriving Jewish diaspora existed prior to the destruction of the Second Temple, and some recent scholarship has stressed the sustainability and creativity of Jewish and other diasporas.

Along with the memory of the land, its reality was preserved throughout the Middle Ages by the reports of occasional pilgrims, including famous Jewish artists and thinkers, such as the twelfth-century philosopher-poet Judah HaLevi. Extremely pious Jews sought to die, or at least to be buried, in the soil of Zion. Small settlements of religious mystics were established in Jerusalem and the Galilee during the early modern period. During the late seventeenth century, the false messiah, Sabbatai Zevi (1626–1676), raised hopes of immediate restoration of the Jews to Zion; Jews across the Western world sold their worldly goods and prepared for the journey that never came.

MODERN ZIONISM

The modern movement of Zionism, understood in large part as a mobilization to “actualize” these ancient hopes and dreams, is inseparable from key aspects of modern European history, including the dissolution of the ancien régime; the rise of secularism and religious pluralism; and the effort to create one-to-one alignments between ethnic collective identities and territorially defined nation-states. As part of the first aspect, Jewish communities were simultaneously freed of historic restrictions on movement, settlement, and employment, and deprived of their historic self-governing character. As part of the second, the haskalah, or “Jewish Enlightenment,” sparked a profound internal critique and resistance to traditional modes of communal authority, based as it was on patriarchy, family, and class prestige, and mastery of religious law and lore. Meanwhile, chauvinist nationalisms in Europe spawned the modern variety of Jew-hatred that went by the “scientific” name of anti-Semitism. This inspired Zionism as a response, claiming that the only possible place for the Jewish people in a modern world of nation-states was together, preferably in its own historical homeland.

Starting in the late nineteenth century, various Zionist manifestos appeared. In Eastern Europe, Leon Pinsker’s (1821–1891) Autoemancipation, which was inspired by a wave of pogroms in 1881 and argued that the Jews would neither be safe nor free so long as they remained in an “abnormal” situation as guests and strangers, was published in 1882. In 1896 the Viennese
Zombie

The journalist Theodor Herzl (1860–1904), who came to be canonized as the founder of Zionism, published his *The Jewish State*, arguing that the Jews would never be free nor gain respect until they ceased being a scattered minority. Ahad Ha’am (1856–1927), who argued that Zion should serve as a spiritual center for the renewal of world Jewry, did not carry the day, but his vision may be seen as a remarkable prediction of the relation between Jewish Israel and the Jews of the diaspora at the start of the third millennium. Intellectuals such as Judah Magnes (1877–1948) and Martin Buber (1878–1965), concerned with the ethical demand to acknowledge the presence and humanity of the Arab inhabitants of Palestine, argued early in the twentieth century for a binational solution to what came increasingly to be understood as a conflict between two nationalist movements struggling for control of the same land. The Revisionists, led by Vladimir Jabotinsky (1880–1940), contended that such reconciliation was impossible and that the conflict might well be a fight to the death, one that the Jews must at all costs win. Meanwhile the most popular variant of Zionism as a popular movement was Socialist Zionism, itself subject to bitter contention, though all of its adherents believed both that the way to revive the Jewish people was through the renewal of Jewish labor in the Jewish land and that the Zionist effort was consistent with the worldwide movement of the working class. Zionist ideology emphasized the close attachment between the people and the land in modern practice, not only in historical memory; and Zionist strategy prior to World War II involved substantial efforts to purchase land in Palestine.

WORLD WAR II AND POSTCOLONIALISM

World War II affected the Zionist movement in profound ways: It seemed to offer convincing proof that there was no safe future for Jews in diaspora, and it led to mass immigration by refugees and survivors to what was, until the late 1940s, still commonly called *Palestine* even by Jews. The establishment of the State of Israel in 1948 and the ensuing war marked a new phase in the history of the movement and the controversies surrounding it. Many Zionists understood themselves as anticolonialists, both because the Jews worldwide whom they sought to redeem could plausibly be understood as being “internally colonized” by various powerful nations and empires, and because the Zionist pragmatic and military effort involved resistance as well as collusion with the British protectorate. Palestinians displaced during the 1948 war known in Israel as the War of Independence were neither allowed by Israel to return to their homes, nor absorbed into surrounding Arab countries, thus exacerbating and perpetuating the Israeli-Palestinian conflict. The Soviet Union, after initially voting in the United Nations for recognition of Israel, came to be aligned with the Arab States and with the Palestinian movement, while much of the world came to see Israel and Zionism as opposed to postcolonial liberation struggles.

Consistent both with the Zionist ideal of worldwide Jewish peoplehood and with the reality of vastly different Jewish communities in various parts of the world, the mass absorption of a large percentage of the world’s Jews has been problematic and controversial. In the decades following World War II, the majority of the Jews of North Africa and the Middle East emigrated to Israel, as did a large percentage of the Jews of Eastern Europe and, somewhat later, the Soviet Union. Tensions arose and persist among these major immigrant groups. In the latter decades of the twentieth century, the secular Zionist goal of shaping the “new Jew,” free of supposed religious obscurantism and the supposed neuroses of diaspora, was challenged both by movements to retain rather than jettison traditional Jewish cultures and by an increasingly popular and militant combination of Zionist-exclusive territorialism and fervent religious orthodoxy. Moreover, a number of scholars and commentators have argued that by the end of the twentieth century, the era of “post-Zionism” had come, meaning that the fundamental goal of establishing and securing a Jewish state had been achieved, but that it was no longer feasible or necessarily desirable to persist in the attempt to gather in all of the world’s Jews.

ZOMBIES

The word *zombie* refers to the “living dead” and originally derives from Central Africa. In Kongo, the cadaver or spirit of a deceased person is called *nzambi*. But the belief in the existence of the “living dead” is widespread, and the term has also been subject to much cross-cultural appropriation, decontextualization, and recontextualization.
Popular discourses associate zombies with the Caribbean Voodoo religion. For example, Haitians believe that malevolent sorcerers sometimes gain control of the bodies of their victims by robbing them of the component of the soul that contains personality, character, and willpower (tibon ange) or by raising them from their graves. The sorcerers then lead their innocent victims in a comatose trance, under cover of night, to distant places where they must toil indefinitely as slaves. The Haitian conception has informed the image of zombies in mass-mediated popular culture as the macabre figure of a corpse in tattered rags, entirely subservient and beholden to the authority of some unknown master. Zombies are portrayed as docile, with glassy empty eyes, and as being without will, memory, and emotion.

A controversial theory by ethnobiologist Wade Davis (1988) suggests that there may well be an ethnobiological basis for reports of the zombie phenomenon in Haiti. He refers to a case of zombification that was verified by a team of physicians. In 1962 Clairvus Narcisse was pronounced dead at a hospital, and buried eight hours later. But Clairvus reappeared in 1980, claiming that his brother had made him a zombie because of a land dispute. Davis argues that Clairvus was mistakenly diagnosed as dead, buried alive, and taken from the grave. Clairvus claimed that following his resurrection from the grave, he was forced to work as a slave with other zombies. He escaped after two years and spent the next sixteen years wandering about the country, fearful of his vengeful brother. Among the various preparations used by Haitian sorcerers, Davis identified a fish containing tetrodotoxin, an extremely potent neurotoxin that induces a complete state of peripheral paralysis and imperceptibly low metabolic levels. Davis postulates that the Haitian belief in zombies could be based on rare instances where an individual receives the correct dosage of the poison and is misdiagnosed as dead. Davis describes zombification as a form of punishment imposed by Bizango secret societies. These societies are arbiters of social life, protect community resources such as land, and use poison and sorcery as weapons.

Other scholars regard the belief in zombies as purely mythical. From a neo-Marxian perspective, the image of zombies as people who are dehumanized and left only with the ability to work is seen as a symbolic commentary on the historical processes of enslavement, colonialization, and proletarianization.

In many parts of Africa, zombies are recognized as an integral aspect of witchcraft discourses, particularly where these address social inequalities. Throughout the Cameroon, nouveaux riches are imagined as witches who no longer eat their victims but change them into zombies. For example, the concept of nyongo emerged amongst the Bakweri after German and British colonists arrogated their land, resettled them on reserves, and allowed strangers to profit from the new economic opportunities. The Bakweri suspected prosperous outsiders of forming witch associations, taking deceased kin from their graves, and transporting the zombie spirits by lorry to Mount Kupe, where they worked on invisible plantations. These beliefs are informed by traumatic memories of the slave trade and of forced labor, as well as by perceptions of wealthy absentee landlords.

In Malawi, witchcraft discourses constitute an argument about the morality of accumulation. Accumulation is endowed with moral adequacy when entrepreneurs make their constitutive relations visible by supporting their kin financially, and by redistributing wealth through patronage, gift giving, and feasting. It is perfectly legitimate when entrepreneurs, who are motivated by these concerns, use medicines to protect their businesses. By contrast, accumulation that is motivated by individualism and greed is morally despised. In this situation, entrepreneurs are said to achieve prosperity at the cost of human lives. Zombies are believed to reside with them, to protect their money, and to attract customers to their businesses. Zombies thus serve exactly the same purposes as medicines, but are an index of morally despicable witchcraft.

In South Africa, images of witches and zombies have multiple symbolic meanings, but capture the desire to dominate and the fear of being dominated. These images resonate with those of elderly women who control the work of their daughters-in-law, and of white industrialists who employ black laborers. The deployment of zombies in a nocturnal “second world” echoes the daunting experiences of young brides who leave their natal households for those of their husband’s family, and of migrants who leave the countryside for alien industrial and mining centers. The smallness of zombies alludes to the diminutive status of these persons, and the idea that their tongues are cut suggests unquestioning obedience.

Z-TEST

In scientific and social investigations, researchers may need to make decisions through statistical-hypothesis testing guided by underlying theory and empirical observa-
Z-Test

The Z-test is one of the most popular techniques for statistical inference based on the assumption of normal distribution. Many social and natural phenomena follow the law of normal (Gaussian) distribution, which was discovered by Carl F. Gauss (1777–1855), a German mathematician, in the early nineteenth century. The normal distribution is one of the fundamental statistical distributions used in many fields of research, and it has a bell-shaped density function with \( \mu \) (mean) representing the central location and \( \sigma^2 \) (variance) measuring the dispersion. The normal density function is

\[
\frac{1}{\sqrt{2\pi} \sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}
\]

A general normal random variable \( X \) with a mean of \( \mu \) and variance \( \sigma^2 \) can be rescaled into the standard normal random variable \( Z \) with mean 0 and variance 1 using

\[
Z = \frac{X - \mu}{\sigma},
\]

where \( \sigma \) is the standard deviation of \( X \). The observed value of \( Z \) is called the Z score. Almost all introductory statistics textbooks provide the table for the probability of \( |Z| \leq \alpha \) or its variants for many convenient values of \( \alpha \) (Agresti and Finlay 1997). These values are available in all statistical software packages.

Statistical hypothesis testing and inference on the population mean are usually performed through a sample of random variables observed from the population. Let \( X_1, X_2, \ldots, X_n \) be \( n \) independent and identically distributed normal random variables with a mean of \( \mu \) and a variance of \( \sigma^2 \), such as the gas mileages of a particular type of vehicle, the annual average income of households in a city, or the vital signs of patients under various treatments.

Denote the sample mean \( \bar{X} = \frac{1}{n} \sum_{i=1}^{n} X_i \) as \( \bar{X} \). Then

\[
Z = \frac{\bar{X} - \mu}{\sigma/\sqrt{n}}
\]

is distributed as the standard normal random variable, where \( \sigma/\sqrt{n} \) is the standard deviation of \( \bar{X} \). This result provides the basis for a one-sample Z-test on the mean (\( \mu \)) of the study population when \( \sigma \) is known. To test the null hypothesis \( H_0: \mu = \mu_0 \) (for example, to test if the mean gas mileage \( |\mu| \) is 25 [\( \mu_0 \) miles per gallon for a particular type of vehicle]), one can form the Z-test statistic as

\[
Z = \frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}}
\]

(4)

One would reject the null hypothesis \( H_0 \) in favor of the alternative \( H_1: \mu \neq \mu_0 \) (the two-sided Z-test) when the observed value of \( Z \) is significantly different from 0. In many situations, one may be interested in a one-sided alternative \( (H_1: \mu < \mu_0 \) or \( H_1: \mu > \mu_0 \)).

In rejecting or accepting the null hypothesis, one could commit two types of errors. The type I error (\( \alpha \)) is the probability of rejecting the null hypothesis when it is true, and the type II error (\( \beta \)) is the probability of accepting the null hypothesis when it is false. The \( p \)-value is the probability of the test statistic as contradictory to \( H_0 \) as the observed \( Z \) value. A detailed study on statistical hypothesis testing is given by Erich Lehmann and Joseph P. Romano (2005). For the two-sided Z-test, one may reject \( \mu = \mu_0 \) in favor of \( \mu \neq \mu_0 \) if the observed \( Z \) value of the test statistic satisfies

\[
|Z| = \left| \frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}} \right| > 1.96.
\]

(5)

The type I error for this test is less than 0.05. The upper bound of the type I error is called the size, and 1-\( \beta \) is called the power of the test. For a test, if the \( p \)-value is less than the size, one may reject the null hypothesis \( H_0 \). A commonly used size is 0.05. For the two-sided Z-test with size 0.05, the critical region is \( |Z| > 1.96 \). The Z-test is closely related to the constructing of confidence intervals. For example, the 95 percent confidence interval for the mean \( \mu \) is

\[
(\bar{X} - 1.96\sigma/\sqrt{n}, \bar{X} + 1.96\sigma/\sqrt{n})
\]

(6)

for the two-sided estimation. If \( X_1, X_2, \ldots, X_n \) are not independent and identically normally distributed, under some conditions, the central limit theorem shows that

\[
Z = \frac{\bar{X} - \text{Mean}(\bar{X})}{\text{Var}(\bar{X})/\sqrt{n}}
\]

(7)

is approximately standard normal when \( n \) is large (typically \( n \geq 30 \)). That is, one can still use the Z-test when \( n \) is large.

In many applications, the standard deviation of the population is unknown. In these cases, one can replace \( \sigma \) with the sample standard deviation \( s \) and form a test statistic as

\[
t = \frac{\bar{X} - \mu_0}{s/\sqrt{n}}
\]

(8)

where

\[
s^2 = \frac{1}{n-1} \sum_{i=1}^{n} (X_i - \bar{X})^2
\]

(9)

is the sample variance. The test follows the \( t \)-distribution of \( n-1 \) degrees of freedom. As \( n \) increases, \( t \) converges to \( Z \). Hence, even when the standard deviation is unknown, the Z-test can be used if \( n \) is large. In fact, the estimates of parameters from many parametric models, such as regres-
tion models, are approximately normally distributed. The Z-test is therefore applicable for statistical inference of these parameters. When comparing the means ($\mu_1$ and $\mu_2$) of two normally distributed populations, $N(\mu_1, \sigma_1^2)$ and $N(\mu_2, \sigma_2^2)$, one can construct a two-sample Z statistic for testing $H_0: \mu_1 - \mu_2 = \mu_0$:

$$Z = \frac{\bar{X} - \bar{Y}}{\sqrt{\frac{\sigma_1^2}{n} + \frac{\sigma_2^2}{m}}}.$$  \hspace{1cm} (10)

where $\bar{X} = \frac{\sum_{i=1}^{n} X_i}{n}$, $\bar{Y} = \frac{\sum_{i=1}^{m} Y_i}{m}$ and $X_i$, $Y_i$ are independent random samples from these two populations respectively.

The two-sample Z-test can be carried out in the same way as the one-sample Z-test. Similar to the case of the one-sample Z-test, the two-sample Z-test corresponds to the two-sample t-test when the population variances are replaced by their sample variances. However, when $n$ and $m$ are large, there is not much difference between the two-sample Z-test and the two-sample t-test. The two-sample t-test is a special case of Analysis of Variance (ANOVA), which compares the means of multiple populations. For a small sample size, it is preferable to use nonparametric methods instead of the Z-test, particularly when it is difficult to verify the assumption of normality.

ANTHROPOLOGY AND ARCHAEOLOGY

Behar, Ruth. *Translated Woman: Crossing the Border with Esperanza's Story*. Boston: Beacon Press, 1993. Researching in Mexico, anthropologist Behar went to a cemetery near the town of Mexquitic and attempted to photograph a Mexican-Native American woman placing flowers on the graves of her children. The woman, to whom Behar assigned the name Esperanza, bargained with Behar. If Behar and her husband would serve as godparents to one of her living children, Esperanza would tell her story to Behar, providing intimate details of the life of women in Mexquitic. The result is Behar's moving portrait of suffering and abuse. This work crystallizes the possibilities associated with subject and observer being collaborators in ethnographic projects.

Davies, Charlotte Aull. Reflexive Ethnography: A Guide to Researching Selves and Others. London: Routledge, 1999. A comprehensive guide to the relationship between the theory and practice of ethnographic research emphasizing the necessity of a self-critical stance by the researcher. Reflexive ethnography pushes researchers to be open about their biases and perspectives and to recognize that their presence can have an impact on the events that they observe and record. It rejects the notion that it is possible to achieve absolute detachment and objectivity in conducting ethnographic research.

Diop, Cheikh Anta. Civilization or Barbarism: An Authentic Anthropology. Translated by Yaa-Lengi Meema Ngemi. Edited by Harold J. Salemson and Marjolijn de Jager. Chicago: Lawrence Hill Books, 1991. Diop presents archaeological and historical evidence to support his assertion that Egypt was a black civilization, and that Greek civilization is indebted to Egyptian learning and accomplishments. The study argues for the centrality of African cultural production in world history.

Freeman, Derek. Margaret Mead and Samoa: The Making and Unmaking of an Anthropological Myth. Cambridge, MA:
Freeman advances a provocative refutation of the conclusions reached by anthropologist Margaret Mead in her famous study of the transition from childhood to adulthood in Samoa.

McClaurin, Irma. *Women of Belize: Gender and Change in Central America*. New Brunswick, NJ: Rutgers University Press, 1996. In a postcolonial critique of gender relations in Belize, McClaurin asks how women find unity to organize themselves for the purposes of self-improvement and collective social change. Across all ethnic groups in one village, an economic-sexual dynamic was uncovered, where female dependence on men restricted women's physical and social mobility. Focusing in depth on three Belizean women of different ethnicities, McClaurin found that participation in organizations focused on traditional women's concerns helped women overcome marginalization.

Mintz, Sidney. *Caribbean Transformations*. Chicago: Aldine, 1974. This volume collects in one place several of anthropologist Mintz's most important articles on Caribbean society. Tracing the history of the region, Mintz analyzes the long-term sociocultural impact of slavery and the plantation system.

Prashad, Vijay. *Everybody Was Kung Fu Fighting: Afro-Asian Connections and the Myth of Cultural Purity*. Boston: Beacon Press, 2001. Prashad analyzes historical evidence of centuries of cultural and political interaction between blacks and Asians around the world, seeking to reject notions of multiculturalism and the primacy of a white majority in favor of a model of polyculturalism. Prashad also presents four ways of thinking about race, exploring ways in which race has been conceptualized in the past and conjecturing on implications for the future.

Prashad, Vijay. *The Karma of Brown Folk*. Minneapolis: University of Minnesota Press, 2000. Prashad discusses how some American political groups have pointed to the success of South Asian immigrants as an example of successful assimilation and proof that the U.S. offers a level playing field (i.e. “South Asians as a ‘model minority’”). Prashad counters this with an argument about America’s selective immigration policy in the late twentieth century that focused on welcoming professionals from Asia.

Sahlins, Marshall. *Culture and Practical Reason*. Chicago: University of Chicago Press, 1976. Sahlins rejects the notion that, unlike other societies, Euro-American peoples can be understood strictly in terms of rational, utilitarian choices. He uses various examples to argue that a society cannot be understood without reference to symbols and meanings unique to its culture.

Sahlins, Marshall. *Stone Age Economics*. Chicago: Aldine-Atherton, 1972. By focusing on aboriginal, precolonial communities, Sahlins raises questions about the conditions of prosperity. He proposes that societies with low levels of material wants and the capacity to meet those wants while having substantial time for leisure are “the original affluent societies.” Thus, Sahlins breaks the conventional link between affluence and consumerism in a major contribution to the field of economic anthropology.

Said, Edward. *Orientalism*. New York: Pantheon, 1978. Perhaps Said’s most influential work, *Orientalism* examines European and U.S. representations of the peoples and societies of the Middle East. The author argues that traditional Euro-American scholarship on the region has created a stereotype of its cultures as irrational, unchanging, violent, and morally degenerate. Such negative stereotypes of the Arab “Orient” and its peoples have long been exploited to justify Euro-American economic and political domination of the Middle East, and they continue to inform both popular attitudes and public policy toward the region.

Scott, David. *Conscripts of Modernity: The Tragedy of Colonial Enlightenment*. Durham, NC: Duke University Press, 2004. Scott argues for a need to reconceptualize the past in evaluating postcolonial history, viewing the transition from colonialism to postcolonialism not as “romance” but rather as tragedy, with important implications for the anticolonial utopias that have experienced conflict and disillusionment.

set of essays that examines what has been learned about the lives of African Americans in the colonial period based upon archaeological findings.

Trouillot, Michel-Rolph. *Silencing the Past: Power and the Production of History*. Boston: Beacon Press, 1995. A collection of five essays probing the meaning and interpretation of history, and considered an important contribution to the anthropology of history. Trouillot cites as one example the significance of the Haitian Revolution, which has not been widely accepted as one of the most important revolutions in world history. Yet, as Trouillot persuasively asserts, that revolution founded an independent black state at a time when the vast majority of blacks in the western hemisphere were enslaved. Trouillot concludes that those wielding power determine which accounts of history are considered authoritative.

Twine, France Winddance. *Racism in a Racial Democracy: The Maintenance of White Supremacy in Brazil*. New Brunswick, NJ: Rutgers University Press, 1997. Twine provides an important ethnographic study on race in Brazil, based on three years she spent in a Northern Brazilian town, that comprehensively challenges the notion that racism is of marginal importance there. She argues that Brazilians define racism with sufficient narrowness so that both everyday acts of racial indignity as well as general patterns of racial inequality often go unchallenged or are attributed to class disparity.

Williams, Brackette. *Stains on My Name, War in My Veins: Guyana and the Politics of Cultural Struggle*. Durham: Duke University Press, 1991. Study of cultural, ethnic, and class conflict in Guyana. Since independence in 1966, the nation-building process in Guyana has shown how a colonial past shapes the way citizens think and act in the postcolonial context. Williams finds that political rivalry is ethnically entrenched, each group claiming superiorities over the other ethnic groups using Anglo-European standards.

**ARTICLES**

**ARTS, MEDIA, AND POPULAR CULTURE**

Bogle, Donald. *Toms, Coons, Mulattos, Mammies, and Bucks: An Interpretive History of Blacks in American Films*. New York: Viking, 1973. Film historian Bogle's first book examines blacks in American films dating back to the era of silent movies. In analyzing their work, Bogle endeavors to reconstruct the cultural and social context of the day for each film produced. Throughout the study, he discusses the stereotypes that black actors were forced to perpetuate—noting, of course, that these films provided black actors with the opportunity for work.

Bourdieu, Pierre. *Distinction: A Social Critique of the Judgment of Taste*. Translated by Richard Nice. Cambridge, MA: Harvard University Press, 1994. Originally published as *La distinction: critique sociale du jugement*, 1979. Using evidence from a survey of more than 1,000 subjects from Paris and two other French towns, Bourdieu argues that taste functions to legitimate social differences and to orient individuals to their sense of social status and belonging. Class differences, Bourdieu asserts, can be discerned from tastes in food, including choice of food as well as preparation, presentation, and even understanding of the effects of that choice on matters of health and well-being. Bourdieu explores the relationship between economic and social conditions, arguing that people attempt to enhance class characteristics by imposing their own classifications and symbolism onto common social experiences.

Carby, Hazel V. *Reconstructing Womanhood: The Emergence of the Afro-American Woman Novelist*. New York: Oxford University Press, 1987. Carby seeks to reconstruct the social, political, and literary contexts in which the earliest novels by African American women writers were produced. She explores the marginalization of black women in history, as well as the racist undercurrents of the women's suffrage movement, in which white women saw themselves as the “ideal of true womanhood.”

sociology of rock is the sociology of youth, Frith discusses rock music's meanings, production, and consumption. Gans, Herbert J. *Popular Culture and High Culture: An Analysis and Evaluation of Taste*. New York: Basic Books, 1974, revised, 1999. Gans describes his study as “an argument for cultural democracy and an argument against the idea that only the cultural expert knows what is good for people and society.” He discusses the multiplicity of “taste cultures” in America and opposes philosophies that suggest that such tastes can or should be improved.

Gilroy, Paul. *The Black Atlantic: Modernity and Double Consciousness*. Cambridge, MA: Harvard University Press, 1993. The black Atlantic is a space where a rich cultural synthesis has occurred in the aftermath of the disasporization of African peoples; the black Atlantan is a person forcibly removed from his home country but never fully accepted or absorbed in the new one. This displacement prompts the “double consciousness” described by W. E. B. Du Bois and acknowledged in Gilroy's title, with implications for an understanding of the work of black artists and intellectuals ranging from Frederick Douglass, Du Bois, and Richard Wright, to modern-day figures like rock musician Jimi Hendrix and novelist Toni Morrison. Gilroy argues for “an explicitly transnational and intercultural” approach to the study of black identity.

Hobsbawm, Eric J. and Terence O. Ranger, eds. *The Invention of Tradition*. Cambridge: Cambridge University Press, 1983. Six essays outline what Hobsbawm describes as the universal practice of inventing traditions during periods of rapid social change, largely for political purposes and for “the inculcation of beliefs, value systems and conventions of behavior.”

Jones, Le Roi (Amiri Baraka). *Blues People: Negro Music in White America*. New York: William Morrow, 1963. Baraka's classic history traces black music from slavery to contemporary jazz, noting the evolving consciousness of black identity as expressed in these works. The blues, a staple of black American music, grew out of the encounter between African and American cultures in the South to become an art form uniquely connected to both the African past and the American soil.

Lott, Eric. *Love and Theft: Blackface Minstrelsy and the American Working Class*. New York: Oxford University Press, 1993. Lott's important historical and cultural study examines the origins of blackface minstrelsy in America, focusing on its design as entertainment for white, male, working-class audiences. Lott asserts that minstrelsy helped to define and give voice to various working-class ideologies, centering his discussion on those involving race, class, and gender.

McLuhan, Marshall and Quentin Fiore. *The Medium Is the Message: An Inventory of Effects*. New York: Bantam, 1967. With a title that offers a pun on McLuhan's famous statement “the medium is the message,” this photomontage seeks to convey McLuhan's declared belief that instead of neutrally presenting content, “all media work us over completely. They are so pervasive in their personal, political, esthetic, psychological, moral, ethical, and social consequences that they leave no part of us untouched, unaffected, unaltered. The medium is the massage.”

Rose, Tricia. *Black Noise: Rap Music and Black Culture in Contemporary America*. Middletown, CT: Wesleyan University Press, 1994. Rose received the American Book Award for this study, considered an outstanding treatment of rap music in its cultural contexts. The author examines the historical evolution of rap, its technological innovations, and the racial, cultural, and sexual politics of the genre.

Sollors, Werner. *Beyond Ethnicity: Consent and Descent in American Culture*. New York: Oxford University Press, 1986. Examines ethnicity in American literature and its implications for an understanding of American culture. Surveying a variety of works from all periods of American history, Sollors focuses on what he describes as the tension between “descent,” the concern for one's heritage, and “consent,” the desire to choose one's own life course and identity.

Szwed, John. *Space Is the Place: The Lives and Times of Sun Ra*. New York: Pantheon, 1997. A sympathetic portrayal of the twentieth-century jazz composer, musician, and orchestra leader Sun Ra (born Herman "Sonny" Blount), whose idiosyncratic temperament and wild claims of space travel were perplexing to many. Szwed explores Sun Ra's concerns with mysticism, Egyptology, and Afrocentrism, tracing his early career and artistry against the background of the emerging civil rights movement in the U.S.

Williams, Raymond. * Marxism and Literature*. Oxford: Oxford University Press, 1977. Williams insists that literature be analyzed in terms of the intentional choices of the writer at each stage of construction, and the grounding of those choices in the conflict of social forces then prevalent. The critic must reconstruct these dynamics and perceive the creative work as a production rather than a finished object.

Williams, Raymond. *Television: Technology and Cultural Form*. London: Fontana, 1974. Williams notes that television, with its centralized transmission for the purpose of a privatized reception, reinforces and extends particular cultural standards. Central to his study of technology and culture is an exploration of cultural assumptions regarding the use of television, and the political and economic structures that influence the creation and growth of new technologies.

ECONOMIC DEVELOPMENT

Amin, Samir. *Accumulation on a World Scale: A Critique of the Theory of Underdevelopment*. 2 vols. Translated by Brian Pearce. New York: Monthly Review Press, 1974. Amin contends that accumulation of capital within advanced capitalist countries impedes development within peripheral societies. Underdevelopment must therefore be considered historically as a part of a heterogeneous world system which is shaped by capitalism, such that “development is possible for the countries of the periphery only if they break out of the world market.”

Boserup, Ester. *The Conditions of Agricultural Growth: The Economics of Agrarian Change Under Population Pressure*. Chicago: Aldine, 1965. Boserup outlines a theory of economic development in “primitive” (non-chemical, non-mechanized) food production centering on population pressure which prompts the adoption of more intensive methods and accompanying adjustments in land use and time allocation. She argues that the long-term effect of intensification is a dramatic rise in productivity in agriculture.

Chenery, Hollis, Sherman Robinson, and Moshe Syrquin. *Industrialization and Growth: A Comparative Study*. New York: Oxford University Press, 1986. The authors explore the relationship between industrialization and economic growth, highlighting quantitatively and empirically the conditions or policies that are most likely to foster industrial development. Special attention is paid to the impact of the industrialization process on income distribution.

Emmanuel, Arghiri. *Unequal Exchange: A Study of the Imperialism of Trade*. Translated by Brian Pearce. London: Monthly Review Press, 1972. Emmanuel seeks to explain why terms of trade for developing countries are so consistently unfavorable, contending that inequality between nations in the international capitalist economy is maintained largely because capital is mobile and labor is immobile.

Nelson, Richard R. and Sidney G. Winter. *An Evolutionary Theory of Economic Change*. Cambridge, MA: Harvard University Press, 1982. The authors outline “an evolutionary theory of the capabilities and behavior of business firms operating in a market environment,” constructing and analyzing models that track “the response of firms and the industry to changed market conditions, economic growth, and competition though innovation.” Their study is a rare and creative extension of Joseph Schumpeter’s framework for analyzing the process of economic development.

Sen, Amartya K. Y. *Development As Freedom*. New York: Anchor, 1999. The Nobel Prize–winning economist argues that the absence of material want, educational opportunity, and civil and political liberties are constituent aspects of his notion of freedom. Greater freedom is, for Sen, economic development which should be the social objective rather than mere economic growth, i.e. increases in per capita income.

ARTICLES

**ECONOMICS**

Barro, Robert J. and Herschel I. Grossman. *Money, Employment and Inflation*. Cambridge, UK: Cambridge University Press, 1976. The authors present their macroeconomic model where, in the absence of instantaneous price adjustments, a condition of general non-market clearing or “general disequilibrium” prevails. This enables them to provide a potential explanation for stagflation, the condition of simultaneously rising prices and unemployment.

Bates, Timothy. *Race, Self-Employment, and Upward Mobility: An Illusive American Dream*. Baltimore: Johns Hopkins University Press, 1997. Bates compares self-employment among Asian and African Americans, arguing that such employment and steadily rising economic success is open only to those who are highly educated and/or possess significant personal wealth and resources.

Bharadwaj, Krishna. *Classical Political Economy and the Rise to Dominance of Supply and Demand Theories*. Calcutta: Orient Longman, 1978. Bharadwaj provides a provocative analysis of the demise of classical political economy (CPE) and the coming to prominence of the marginalist school. She argues that the assumptions of context of CPE were too readily mobilized on behalf of the interests of labor to meet with ongoing acceptance by the defenders of capitalism and, hence, fell into disfavor with the emergence of the more politically palatable supply and demand theories.

Bibliography

Friedman, James. *Oligopoly and the Theory of Games*. Amsterdam: North-Holland Publishing Co., 1977. Friedman applies game theory systematically to the problem of oligopoly, a small number of sellers in a market who must anticipate the reactions of their rivals in making their own decisions about how to price their product.

Fudenberg, Drew and Jean Tirole. *Game Theory*. Cambridge, MA: MIT Press, 1991. Provides an introduction to non-cooperative game theory, which studies the behavior of agents when confronted with the knowledge that each agent's best choice is dependent upon forecasting an opponent's choice. The authors apply their findings and theories to political science as well as economics.

Galbraith, John Kenneth. *The New Industrial State*. London: H. Hamilton, 1967. Galbraith advances his notion that the United States is no longer a free-enterprise economy or society, and that large corporations control a structured state that creates demand that was previously non-existent through advertising.

Harcourt, Geoffrey C. *Some Cambridge Controversies in the Theory of Capital*. Cambridge, UK: Cambridge University Press, 1972. An entertaining explication of the sometimes heated exchanges, originally centered on disputes over the theory of capital, that took place between faculty in the two Cambridges (University of Cambridge in England and Massachusetts Institute of Technology in the U.S.). At the base were two competing and somewhat incompatible views of the economic system. While clearly allied with the Cambridge, England side of the debate, Harcourt provides an accurate description of the positions taken by both sets of disputants and the issues at stake.

Lewis, W. Arthur. *Growth and Fluctuations 1870–1913*. Boston: Allen & Unwin, 1978. Lewis, the Nobel Prize winner in economics in 1979, presents evidence from the late 19th and early 20th centuries that growth in countries exporting primary products was dependent on their capacity to trade with countries that were centers of manufacturing activity.

Mills, Edwin. *Urban Economics*. Glenview, IL: Scott, Foresman, 1972. Mills utilizes economic theory to analyze urban difficulties and issues. An economic history of urban areas in the U.S. is offered, along with basic theoretical models that amplify the histories. Mills also discusses urban policy in the housing market, transportation, and within local government.

Olson, Mancur. *The Logic of Collective Action: Public Good and the Theory of Groups*. Cambridge, MA: Harvard University Press, 1965. Olson unveils his original theory of group and organizational behavior that can be applied across many social sciences. Olson contends that most organizations produce an output that is analogous to a public good and is available to all participants in the organization or the society, regardless of how much individual effort they have put into its making, the "free rider" problem.

Schor, Juliet B. *The Overworked American: The Unexpected Decline in Leisure*. New York: Basic Books, 1993. Schor details data that show Americans spend increasingly more time at work and less time with families or at leisure. Schor blames both the pursuit of profits among corporations and the pursuit of higher pay and benefits among workers. Schor offers solutions in the form of a more minimal approach by workers and business operators.

theory of social choice, which the author helped devise with Kenneth Arrow. Sen's work focuses upon the inequalities within individual rights and the availability of information relating to individual conditions. This text influenced researchers to look at basic welfare, at times apart from traditional economic models of analysis.

Sen, Amartya K. *Inequality Reexamined*. Cambridge, MA: Harvard University Press, 1995. Sen discusses the importance of governments paying attention to their poorest citizens. Sen argues that governments have the capability to not only prolong the lives of the poor but can extend significant opportunities for their betterment. For such writing and other texts like it, Sen won the Nobel Prize for economics in 1998.

Sraffa, Piero. *Production of Commodities By Means of Commodities: Prelude to a Critique of Economic Theory*. Cambridge, UK: Cambridge University Press, 1960. This slim volume represents the culmination of Sraffa’s attempt to develop a model that characterizes “general equilibrium” for an economy with the attributes of the system of classical political economy. This contrasts sharply with the general equilibrium features of a neoclassical economy of the type examined by Arrow and Debreu or Arrow and Hahn. Central to Sraffa’s framework is the condition of a uniform rate of profit in all activities. Sraffa is the key figure in the resuscitation of classical political economy in theoretical economics and in the emergence of what has been labeled Neo-Ricardian economics.

ARTICLES

that country’s success in “promoting a more racially equitable system.” The study focuses on school governance, funding, and curriculum for the period 1994–2002.

Freire, Paolo. *Pedagogy of the Oppressed.* New York: Continuum, 1970. Freire proposes that oppressed peoples must be encouraged and taught to think more critically and to be persuaded to take action against their oppressors. He criticizes much of Western society (especially its system of public education) and capitalism, calling for a communal approach to liberation.

Jencks, Christopher, et. al. *Inequality: A Reassessment of the Effect of Family and Schooling in America.* New York: Basic Books, 1972. The analysis of “the dynamics of adult inequality” is at the core of this work and has to be seen in the historical context of the 1960s War on Poverty and its programs designed to guarantee equality of opportunity. For Jencks, the origins of inequality pervade America’s economic, social, political, and cultural institutions; thus, reforming the educational system alone would not fix the problem. The authors demonstrate that there is no evidence that larger school budgets or racial integration reduce learning inequalities as they are tested and measured by standard tests of verbal ability, reading comprehension, and math skills. The failure of such programs, Jencks concluded, was due to an “inadequate conceptualization of equality,” not lack of resources.

Jencks, Christopher and Meredith Phillips, editors. *The Black-White Test Score Gap.* Washington, DC: Brookings Institution Press, 1998. The Jencks and Phillips edited volume includes a set of 15 papers commissioned in preparation of a series of workshops convened to assess “general knowledge of cognitive skills and schooling.” The studies revealed that test score gaps between blacks and whites contribute both to subsequent racial disparities in educational attainment and in income. The papers seek to explore comprehensively the reasons for the racial gap in test score performance and to arrive at solutions to close the gap.

Kane, Thomas J. *The Price of Admission: Rethinking How Americans Pay for College.* Washington, DC: Brookings Institution Press, 1999. Kane employs empirical data and analysis to review federal education policy designed to make college more accessible to students, arguing that removing certain barriers within the admissions process of institutions may have a more significant impact than merely increasing student financial aid.

Lewis, Amanda. *Race in the Schoolyard: Negotiating the Color Line in Classrooms and Communities.* New Brunswick, NJ: Rutgers University Press, 2003. Lewis examines how race is perceived among students, teachers, and parents in elementary schools. Lewis aims to show how racial classification in even the most seemingly mundane aspects of schooling can have a profound effect on students, and argues that cultural differences between black and white students are not seen neutrally.

Oakes, Jeannie. *Keeping Track: How School Structure Inequality.* New Haven, CT: Yale University Press, 2005. Described as one of the most influential works on American education, Oakes’s study demonstrates that tracking (orienting and grouping students based on presumed ability) is a reflection of underlying social, ethnic/racial, and gender inequalities and perpetuates preexisting disparities.

Silberman, Charles S. *Crisis in the Classroom: The Remaking of American Education.* New York: Vintage, 1971. In the author’s own words, this book is about “the crisis in the classroom—the public school classroom, the college classroom, the national ‘classroom’ created by the mass media and by the operation of the American political system—as both a reflection of and a contributor to the larger crisis of American society.”

Tatum, Beverly Daniel. *Why Are All the Black Kids Sitting Together in the Cafeteria?: A Psychologist Explains the Development of Racial Identity.* New York: Basic Books, 1997. Tatum explains why and how black students need to come together in an environment in which racial stereotypes are not necessarily overt. She implores white students to ignore the privilege of their skin color and work to combat racial injustice and intolerance.

Wolf, Alison. *Does Education Matter? Myths About Education and Economic Growth.* London: Penguin, 2002. Wolf presents an iconoclastic study in which she calls into question beliefs widely held by economists and other social scientists that increased educational attainment in a society raises the rate of economic growth. She explicitly addresses the paradoxical condition that increased education for individuals appears to increase their personal income prospects but increased education across a population does not seem to be associated with higher average per capita income.

**BIBLIOGRAPHY**

196 INTERNATIONAL ENCYCLOPEDIA OF THE SOCIAL SCIENCES, 2ND EDITION

**HISTORY AND HISTORIOGRAPHY**

Anderson, Perry. Passages From Antiquity to Feudalism. London: New Left Books, 1974. One of the foremost contemporary Marxist theorists, Anderson has been acknowledged as an authority on leftist politics and history. He charts the socio-political evolution of Europe and its economies from antiquity through the feudal system in this study.

Cantor, Norman F. In the Wake of the Plague: The Black Death and the World It Made. New York: Free Press, 2001. Cantor chronicles the advent of the plague with a biomedical survey, speculation as to its origins, and a record of the devastation it caused, including a mortality rate of 40 percent of the population. The author discusses fears of a Jewish conspiracy, the political effects on lineage and genealogy, and the possibility that a variety of anthrax was partly responsible for the large number of deaths.

Caro, Robert A. The Power Brokers: Robert Moses and the Fall of New York. New York: Knopf, 1974. Chronicles the career of New York’s longtime public works commissioner Robert Moses. Caro details the building projects Moses planned, organized, and completed during his career. He also examines the enormous power that public authority commissions— which are funded by their own taxes and managed by unelected bureaucrats—have in the nation’s big cities.

**ARTICLES**

**GEOGRAPHY**

Harvey, David. Social Justice and the City. Baltimore, MD: Johns Hopkins University Press, 1973. Harvey argues that the field of geography must cease to remain neutral to urban poverty and other societal ills, contending that capitalism destroys living space to fuel its own growth. The book is an iconic example of the then-emerging field of “Marxist geography.”

Rose, Gillian. Feminism and Geography: The Limits of Geographical Knowledge. Minneapolis, MN: University of Minnesota Press, 1993. Radical work arguing that capitalism represents the male species equating women with property. Rose also discusses her observations regarding bodies located in spaces and, subsequently, spaces mapped onto bodies.
the debate about factors leading to Britain’s abolition of the slave trade in 1807.

Constable, Pamela and Arturo Valenzuela. A Nation of Enemies: Chile Under Pinochet. New York: Norton, 1991. A social and political portrait of Chile from the middle of the 1960s to the early 1990s, examining the origins and results of the dictatorship under Pinochet that led to deep divisions in Chilean society and the “nation of enemies” alluded to in title.

Curtin, Philip D. The Atlantic Slave Trade: A Census. Madison: University of Wisconsin Press, 1969. Curtin’s ground-breaking study assesses and analyzes the numerical dimensions of the Atlantic slave trade. The author surveyed existing literature, slave import figures, shipping records, and other primary documents to provide compelling new estimates of the number and distribution of slaves transported during a period of more than four centuries beginning in the 1400s.

Diamond, Jared. Guns, Germs, and Steel: The Fates of Human Societies. New York: Norton, 1997. Diamond’s study, which won him the 1998 Pulitzer Prize in nonfiction, offers a thought-provoking theory of how the peoples of Europe and Asia were able to conquer those of the Americas, Africa, and Australia. His thesis is not that Europeans and Asians are genetically or otherwise superior but that immunological history (an “unequal germ exchange”) proved decisive in shaping the international disparities in economic development that are present in the contemporary world.

Diop, Cheikh Anta. The African Origin of Civilization: Myth or Reality? Edited and translated by Mercer Cook. New York: Lawrence Hill, 1974. Classic study in which Diop presents historical, archaeological, and anthropological evidence to show that the ancient Egyptians were phenotypically black, and that the earliest forms of civilization can be traced to sub-Saharan Africa.

Dirks, Nicholas B. Castes of Mind: Colonialism and the Making of Modern India. Princeton: Princeton University Press, 2001. Dirks maintains that the long-term British colonial rule of India required a deliberate and calculated manipulation of the Indian caste system, noting that Britain used the caste system as a means of organizing and controlling the various social groups and hierarchical layers of Indian society.

Fogel, Robert and Stanley Engerman. Time on the Cross: The Economics of American Negro Slavery. 2 vols. Boston: Little, Brown, 1974. Fogel (winner of the 1993 Nobel Prize in Economics) and Engerman contend that slavery was a robust economic institution prior to the Civil War and that the slaves themselves—on average—fared slightly better than free white farm laborers. The authors were careful to make clear that they were not passing a moral judgment on slavery, but rather analyzing the institution from an economic viewpoint.

Foucault, Michel. Madness and Civilization: A History of Insanity in the Age of Reason. Translated by Richard Howard. New York: Pantheon, 1965. In a study considered by many to be his masterpiece, Foucault traces the evolution of the human concept of madness from the middle ages through the eighteenth century.

Ignatiev, Noel. How the Irish Became White. New York: Routledge, 1995. A study of the change in status of Irish immigrants to the United States in the early 1800s. While the Irish were initially discriminated against, Ignatiev asserts that they became “white” in order to improve their position economically and politically in a competitive society. The Irish ousted blacks, sometimes using violence, from shared neighborhoods and from widely held lower-class jobs.

Jalal, Ayesha. The Sole Spokesman: Jinnah, the Muslim League, and the Demand for Pakistan. Cambridge, UK: Cambridge University Press, 1985. An important and provocative study of the factors leading to the creation of Pakistan in 1947, including the role of the leader of the Muslim League in India and first Prime Minister of Pakistan, Mohammed Ali Jinnah.

Lewis, David Levering. When Harlem Was in Vogue: The Politics of the Arts in the Twenties and Thirties. New York: Knopf, 1981. Lewis analyzes the phenomenon known as the Harlem Renaissance, detailing the social, cultural, and historical influences that shaped the artistic achievements for which this period and place have been celebrated. He seeks to reexamine the Renaissance from the perspective of a variety of important participants: not only the black authors, artists, and musicians whose works were “in vogue,” as the title suggests, but also whites who were writers, artists, wealthy patrons, or otherwise influential in race matters.

Bibliography

McDougall, W. A. *The Heavens and the Earth: A Political History of the Space Age.* New York: Basic Books, 1985. Exploring the space race from the end of World War II through the Apollo 11 moon landing in 1969, the author comments on the implications of this drive into space for public policy at various levels.

Mintz, Sidney W. *Sweetness and Power: The Place of Sugar in Modern History.* New York: Viking Penguin, 1985. Arguing that sugar was both a part of, and an agent in, the rapid modernization of European life, Mintz speculates about the political, cultural, and social significance of sugar consumption. He reveals that sugar was used primarily by the wealthy as a spice, medicine, and decoration as late as the sixteenth century, and only later assumed its modern role as a sweetener and preservative.

Ortiz, Paul. *Emancipation Betrayed: The Hidden History of Black Organizing and White Violence in Florida From Reconstruction to the Bloody Election of 1920.* Berkeley: University of California Press, 2005. Ortiz provides the first major study of white political violence in the state of Florida in the early part of the 20th century as the central mechanism to disenfranchise the state’s black electorate.

Sheridan, Richard B. *Doctors and Slaves: A Medical and Demographic History of Slavery in the British West Indies, 1680–1834.* Cambridge: Cambridge University Press, 1985. Sheridan examines slavery in the British West Indies, analyzing the sharp differences between the slave workforce in the American south, which increased in number by natural means, and that in the Caribbean, where slaves could not reproduce or endure long enough to maintain a steady population.

Williams, Eric. *From Columbus to Castro: The History of the Caribbean, 1492–1969.* London: Deutsch, 1970. Important study by historian Williams (first Prime Minister of Trinidad and Tobago), focusing on the history of sugar and its production in the Caribbean. Williams begins with Columbus, who brought sugarcane from the Canary Islands to the Caribbean on his second voyage to the New World, and ends his analysis with Fidel Castro and his rule of Cuba.

**ARTICLES**

**INTERNATIONAL RELATIONS, ORGANIZATION, AND LAW**

Allison, Graham. *Essence of Decision: Explaining the Cuban Missile Crisis.* New York: Little, Brown, 1971. Allison’s landmark work examines the 1962 nuclear weapons crisis between the United States and Soviet Union by applying the events of the situation to three decision-making models in order to help explain group behavior in organizations. This work introduced the term “groupthink” to the academic and mainstream lexicon and is required reading in many areas of study.

1968. Barnet traces the history of United States covert intervention in foreign revolutions in the 20th century. In addition to discussing events ranging from Franklin D. Roosevelt’s blocking of a proposed constitutional amendment requiring a national referendum on sending troops overseas to the Truman Doctrine and the war in Vietnam, Barnet gives detailed attention to the role taken by the U.S. Central Intelligence Agency in foreign political developments.

Huntington, Samuel. *The Clash of Civilizations and Remaking of World Order*. New York: Simon & Schuster, 1996. Huntington argues that the world need not be viewed as a collection of states, but as a set of “zones” of civilizations that are destined for conflict based on clashes of identity. Huntington posits that western civilization should most worry about Islam and its theories of cultural superiority combined with the inferiority of their collective power on the world stage.

Mamdani, Mahmood. *Good Muslim, Bad Muslim: America, the Cold War, and the Roots of Terror*. New York: Pantheon, 2004. Mamdani discusses the way many Americans view Muslims, noting that Muslims who support the West are labeled secular and “good,” while Muslims who disagree with Western policies are pejoratively considered fundamentalist and “bad.” The tenets of terrorist organizations such as al-Qaeda, writes Mamdani, are based in politics and not religion, a critical difference ignored by the West. More importantly, Mamdani insists that Americans must understand the role of the U.S. government in creating some of these radical movements not only in the Middle East, but also in Africa and Asia.

Rueschemeyer, Dietrich, Evelyne Huber Stephens, and John D. Stephens. *Capitalist Development and Democracy*. Chicago: University of Chicago Press, 1992. Focusing on the economies and societies of advanced industrial countries and nations in Latin America and the Caribbean, the authors contend that capitalist development is associated with democracy because it transforms class structure, empowering the working and middle-classes and making it more difficult for elites to exclude them.

ARTICLES

Krugman, Paul. “Competitiveness: A Dangerous Obsession.” *Foreign Affairs* 73, no. 2 (July/August 1994).

LINGUISTICS

Heidegger, Martin. *Poetry, Language, Thought*. Trans. Albert Hofstadter. New York: Harper & Row, 1971. This collection of seven essays by Heidegger examines his interest in poems, poetry, and poets (as well as painters and prose authors) not as an artistic or cultural critic, but from his particular point of view known as "ontological knowledge." Heidegger's aim is to focus on art as a guide in the "investigation of Being."

**METHODOLOGY**

**PHILOSOPHY OF SCIENCE**

Foucault, Michel. *The Order of Things: An Archaeology of the Human Sciences*. New York: Pantheon, 1971. Foucault introduces his archaeological method, presenting the idea that "in any given culture and at any given moment there is only one episteme (a system of instincual knowledge) that defines the conditions of possibility of all knowledge." Foucault then attempted "to dig up and display the ‘archaeological’ form or forms which would be common to all mental activity," tracing these forms throughout historic cultures.

Heidegger, Martin. *Being and Time*. Translated by John Macquarrie and Edward Robinson. London: Blackwell, 1962. Heidegger felt that it was man's primary duty to define the word "being." He was driven to "pose anew the question" in this study by his belief that man—in the classical Greek period—had hastily applied the assumption that truth was whatever was intellectually perceived as correct. For Heidegger, it was not enough to say simply that something existed. He devoted most of his lifetime to addressing this difficult problem of metaphysics. Heidegger's work is essential to studies of ontology.

Kuhn, Thomas. *The Structure of Scientific Revolutions*. Chicago: University of Chicago Press, 1962. One of the most important philosophical works of the mid-twentieth century, Kuhn's analysis of the research process utilized by scientific inquirers and their psychological make-up has influenced academic work and study in diverse fields since its publication. Kuhn may best be remembered for his use in this book of terms such as "paradigm shift" and "normal science."

UK: Cambridge University Press, 1978. A wide array of papers written by Lakatos are compiled into two primary sections: the first concentrating on the philosophy of the physical sciences, the second containing many previously unpublished essays on the philosophy of mathematics.

Sartre, Jean-Paul. Being and Nothingness: An Essay on Phenomenological Ontology. Translated by Hazel E. Barnes. New York: Philosophical Library, 1956. The famed French existentialist examines man, the being who questions being, and concludes that he is both his body occupying a place in the world — that is, an object among objects — and a subject or a consciousness reflecting on objects. Sartre contends that all consciousness is consciousness of something. Since it is basically a negating — or distinguishing — function (saying that this chair, for instance, is not this table), consciousness produces the concept of nothingness; man is the being by whom negation is introduced into an otherwise complete world.

Sartre, Jean-Paul. Search for a Method. Translated by Hazel E. Barnes. New York: Knopf, 1963. Sartre contends that existentialism and a study of the individual's role in history is central to an understanding of Marxism.

POLITICAL SCIENCE

Aldrich, John Herbert. Why Parties? The Origin and Transformation of Political Parties in America. Chicago: University of Chicago Press, 1995. Aldrich examines the origins and development of political parties in America, noting how the party system offers a solution to three primary problems of democracy: limiting the number of candidates seeking office; mobilizing voters; and achieving consensus to accomplish political goals.

Almond, Gabriel A. and Sidney Verba. The Civic Culture: Political Attitudes and Democracy in Five Nations. Princeton, NJ: Princeton University Press, 1963. Writing during an era that saw the formation of several new democracies around the world, Almond and Verba argue that such governments thrive not only when their structures and institutions are democratic, but also when their ideals are supported by an egalitarian culture. The authors define this culture as one "based on communication and persuasion, a culture of consensus and diversity, a culture that permitted change but moderated it."

Dahl, Robert A. Democracy and Its Critics. New Haven, CT: Yale University Press, 1989. Dahl defends democracy against arguments that democratic government has elements of coercion and that true democracy is impossible due to the inevitable presence of a social elite. The author maintains that a wide distribution of wealth is necessary for meaningful political democracy and proposes greater civic participation by the random incorporation of groups of citizens within the structure of government.

Dahl, Robert A. Polyarchy: Participation and Opposition. New Haven, CT: Yale University Press, 1971. Dahl's study is concerned with two main variables of democracy: competition among various political individuals and forces, and participation among those citizens afforded the right to participate in the democratic process. Dahl argues that a "polyarchy," or a system including the greatest number of participants, should be the goal of the ideal society.

Hirschman, Albert O. Exit, Voice and Loyalty: Responses to Decline in Firms, Organizations, and States. Cambridge, MA: Harvard University Press, 1970. Hirschman maintains that business corporations typically operate at merely a "satisfactory level," as opposed to maximum efficiency, which in turn leads to a deterioration in times of weaker competition. He outlines the concepts of "exit" and "voice" as consumer options when businesses operate at unsatisfactory levels, applying this same theory to the two-party political system in the United States.

Kariel, Henry. The Decline of American Pluralism. Palo Alto, CA: Stanford University Press, 1961. Kariel uses Nietzsche's idea of the impossibility of humans grasping final social and political truths as a base to argue that political scientists must work to question established truths about pluralism as well as to actively create a new democracy catering to all citizens.
Kariel, Henry. *Open Systems: Arenas for Public Action*. Itasca, IL: Peacock, 1969. Student protests against the Vietnam War, urban decay and violence, government scandals and a backlash against traditional reliance on established institutions informed Kariel’s critique of traditional methods within the study of political science, and his argument of the need for a more egalitarian democracy.

Laclau, Ernesto. *Emancipation(s)*. New York: Verso, 1996. Laclau’s collection of essays focus on the postmodern political world and the various and competing interests that attempt to be heard, recognized, and rewarded in western democracies. The author argues that certain changes occurring in the twentieth century completely altered previous definitions of “emancipation.”

Mamdani, Mahmood. *Citizen and Subject: Contemporary Africa and the Legacy of Late Colonialism*. Princeton, NJ: Princeton University Press, 1996. Mamdani explains the unequal distribution of power that exists in many post-colonial African countries as legacies of a system that allowed urban residents, or “citizens,” more rights and privileges than those people in rural areas, the “subjects.” Eventually, as colonial governments withdrew, collapsed, or were overthrown, repressed “subjects” began struggling with the “citizens” for power, beginning conflicts throughout the African continent.

Marcuse, Herbert. *One-Dimensional Man: Studies in the Ideology of Advanced Industrial Society*. Boston: Beacon Press, 1964. This work was a major influence upon many of the student movements of the mid-to-late 1960s in the United States and Europe. Marcuse synthesizes the works of Marx and Freud to argue that man lives in a deficient society dominated by capitalism. He gives particular attention to the military-industrial complex in the United States, which he criticizes as the cause of a wealth of unnecessary spending and irreparable environmental damage.

Polsby, Nelson W. *Community Power and Political Theory*. New Haven, CT: Yale University Press, 1963. Polsby studies communities in which a social and economic elite dominate each community’s political institutions, contradicting the prevailing stratification theory and arguing for a new pluralism.

Pressman, J. L. and Aaron Wildavsky. *Implementation: How Great Expectations in Washington are Dashed in Oakland, or, Why it’s Amazing that Federal Programs Work at All*. Berkeley, CA: University of California Press, 1973. The authors examine the difficulties inherent in implementing a political or governmental policy, even when attempted by public servants with the best of intentions.

Skocpol, Theda. *States and Social Revolutions: A Comparative Analysis of France, Russia, and China*. New York: Cambridge University Press, 1979. This comparative analysis studies three nations that underwent significant social revolution, and how each movement was fomented by factors involving state structures, international events, and class relations.

Swain, Carol M. *Black Faces, Black Interests: The Representation of African Americans in Congress*. Cambridge, MA: Harvard University Press, 1993. Challenges the notion that only African Americans can represent black interests effectively in Congress. Swain argues for black and white representatives to form coalitions to better serve their constituents.

Verba, Sidney, Kay Schlozman and Henry E. Brady. *Voice and Equality: Civic Voluntarism in American Politics*. Cambridge, MA: Harvard University Press, 1988. The authors examine the level of political participation among various strata of the American population, analyzing the impact and class and income on political involvement.

Wolfinger, Raymond and Steven J. Rosenstone. *Who Votes? New Haven*, CT: Yale University Press, 1980. Wolfinger and Rosenstone analyze U.S. Census Bureau surveys of over 90,000 Americans in 1972 and again in 1974. The authors study ever-increasing levels of voter apathy in the United States, showing that education, age, and residential mobility explain almost all of the differences among American voters’ rates of turnout. Wolfinger and Rosenstone were the first to demonstrate what is now a common assumption among students of elections: higher voter turnout would not affect the results of elections.

PSYCHOLOGY

Aronson, Elliot. The Social Animal. San Francisco, CA: Freeman, 1972. Aronson presents a lucid introduction to the world of social psychology, maintaining that the purpose of his study is to “spell out the relevance that sociopsychological research might have for some of the problems besetting contemporary society.” His study offers insight into the challenges involved in applying experimental methods to social psychological queries.

Eagly, Alice H. and Shelly Chaiken. The Psychology of Attitudes. Orlando, FL: Harcourt Brace Jovanovich, 1992. An important overview of attitude research from a psychological perspective. Noting the lack of relation between attitude and action, Eagly and Chaiken stress that social contexts, and the ways in which social norms and expectations complicate laboratory findings, must be considered in the research of social psychologists.

Fanon, Frantz. The Wretched of the Earth. 1961. Translated by Constance Farrington. New York: Grove, 1963. Fanon’s now classic study of the meaning, necessity, and inevitability of violence in the process of liberation extends his exploration of the psychological impact of colonialism on the colonized and the colonist.

Flavell, John H. The Developmental Psychology of Jean Piaget. London: Van Nostrand, 1963. Explores Piaget’s development system of analyzing intellectual growth. Flavell asserts that his purpose is to “speak clearly for Piaget to anyone who has reasons to listen to what he has to say who has some background and sophistication in psychology or related disciplines.”

Gardner, Howard. Frames of Mind: The Theory of Multiple Intelligences. New York: Basic Books, 1983. Gardner argues that intelligence is a psychological construct, and that there are not just two basic forms of intelligence—math/music and verbal—but rather many forms, including linguistic, spatial, and bodily kinetic, which the author defines according to specific criteria.

Gilligan, Carol. In A Different Voice: Psychological Theory and Women’s Development. Cambridge, MA: Harvard University Press, 1982. Groundbreaking study in which Gilligan rejects the notion that women are inferior to men in the realm of moral reasoning. The author proposes that women’s psychological development—especially their identity and moral development—have long been judged erroneously by standards set by and for men. Men and boys, the study argues, tend to define themselves as separate beings and solve moral problems in accordance with abstract principles, while women tend to describe themselves as living in connection with others, and to consider interpersonal relationships when resolving human problems. Gilligan argues that both separation and connection are human experiences, and that men and women tend to take different—and valid—approaches to defining and solving moral problems.

Kahneman, Daniel and Amos Tversky, eds. Choices, Values, and Frames. Cambridge, UK: Cambridge University Press, 2000. This volume is comprised of academic papers from a diverse group of journals, and includes original chapters written by the editors. Together they examine new perspectives on decision and value, the fundamental categories of choice.

Lacan, Jacques. The Four Fundamental Concepts of Psychoanalysis. New York: Norton, 1978. Lacan’s study is based on a year-long seminar he conducted with the goal of introducing “a certain coherence into the major concepts on which psychoanalysis is based.”

Milgram, Stanley. Obedience to Authority: An Experimental View. New York: Harper and Row, 1974. Outlines the results of Milgram’s controversial 1960s laboratory experiments on human conformity and aggression. Milgram postulated that the “most fundamental lesson” of his study is that “ordinary people, simply doing their jobs, and without any particular hostility on their part, can become agents in a terrible destructive process. Moreover, even when the destructive effects of their work become patentiy clear, and they are asked to carry out actions incompatible with fundamental standards of morality, relatively few people have the resources needed to resist authority.”

Schachter, Daniel. Searching for Memory: The Brain, the Mind, and the Past. New York: Basic Books, 1996. The numerous neurological and cognitive factors that have been shown to affect memory are analyzed in discussions of amnesia, inaccurate recall, the forms of memory, and recovering memory of past sexual abuse.

ARTICLES

SOCIAL ISSUES AND POLICY
Clotfelter, Charles and Philip J. Cook. Selling Hope: State Lotteries in America. Cambridge, MA: Harvard University Press, 1989. The authors explore the business of state lottery commissions throughout the U.S., analyzing the history of the lottery, the various games and players, marketing schemes, and public policy issues over the role and involvement of state government.

Folbre, Nancy. Who Pays for the Kids? Gender and the Structures of Constraint. New York: Routledge, 1994. Feminist economist Folbre examines the unequal distribution of the “costs of caring” between men and women, analyzing individual choice within structures of constraint based on gender, age, sex, nation, race and class. She compares political movements, policies, and programs in the United States, Europe, and Latin America and the Caribbean.

Frank, Robert H. and Philip J. Cook. The Winner-Take-All Society: Why the Few At the Top Get So Much More than the Rest of Us. New York: Penguin, 1996. Frank and Cook examine the market forces that combine to create great income disparity, with the spoils going to the ultimate “winner” in economic contests. The authors argue that this phenomenon is not confined to the fields of entertainment and professional athletics, but permeates almost every other endeavor.

Friedan, Betty. The Feminine Mystique. New York: Norton, 1963. Friedan’s classic study helped launch the modern women’s movement by debunking the myth of the post-war woman—a content homemaker who deferred her own ambitions and interests to take care of her family. Friedan was the first writer to analyze how the perpetration of this stereotype belied the complexity of most women’s lives. With the publication of the book, she became one of the women’s movement’s most visible proponents, participating in the founding of the National Organization for Women (NOW) in 1966 and lobbying incessantly for such causes as the passage of the Equal Rights Amendment and legalization of abortion.

Greer, Germaine. Sex and Destiny: The Politics of Human Fertility. New York: Harper and Row, 1984. Greer analyzes social institutions centering on human reproduction, commenting on the influence of European and American thought on fertility in the developing world. The noted and controversial feminist depicts sexual freedom as a step backward in modern society, informing the reader that the modern world is decidedly opposed to reproduction. Greer also objects to contemporary attitudes toward sex and children, asserting that children are treated as commodities.

Harrington, Michael. The Other America: Poverty in the United States. New York: Macmillan, 1962. Harrington’s classic work has been called the seminal treatise on poverty in the United States. He argued that an underclass of poor existed in America and was neglected by the rest of society. This underclass lived in a “culture of poverty” that made it difficult for its members to escape their condition. Harrington’s study drew the attention of President John F. Kennedy and led to the programs comprising the “War on Poverty.”

Harvey, Philip. Securing the Right to Employment: Social Welfare Policy and the Unemployed in the U.S. Princeton, NJ: Princeton University Press, 1989. Harvey examines the history of federal and state welfare and other entitlement programs designed to assist the unemployed, analyzing the effectiveness and results of these policies.

Hernstein, Richard J. and Charles Murray. The Bell Curve: Intelligence and Class Structure in American Life. New York: The Free Press, 1994. Hernstein and Murray argue that genetically determined intelligence—rather than economic background, family dynamics, discrimination, and so on—dictates academic levels of achievement, employment, income, and behavior, including patterns of criminality. The authors contend that social stratification increasingly is based upon levels of intelligence, which they also argue varies systematically by race and gender, with important implications for public policy.

Ryan, William. Blaming the Victim. New York: Pantheon, 1971. Ryan confronts and challenges conventional thinking about the root causes of poverty, particularly the "culture of poverty" hypothesis. Instead of viewing the poor as agents of their own social dysfunctionality, Ryan argues that their condition is due to structural factors that entrap them.

Skocpol, Theda. Protecting Soldiers and Mothers: The Political Origins of Social Policy in the United States. Cambridge, MA: Belknap Press, 1992. A detailed case study in social policy and history that analyzes the period between the 1880s to the 1920s in the United States. Skocpol examines the interrelation between government, interest groups, culture, and unions in formulating public policy. She also addresses the key influence of women in the advocacy of welfare programs and other social policies.

Wilson, William Julius. The Truly Disadvantaged: The Inner City, the Underclass and Public Policy. Chicago: University of Chicago Press, 1987. Wilson's defining work argues that the rise of urban poverty in the latter half of the twentieth century can be traced to major shifts in the American economy during that same period.

ARTICLES

SOCIOLOGY

Bonilla-Silva, Eduardo. Racism Without Racists: Color-Blind Racism and the Persistence of Racial Inequality in the United States. Lanham, MD: Rowman and Littlefield, 2003. Short answer surveys and polling data indicate dramatic improvements in racial attitudes in the United States over the past half-century. Bonilla-Silva argues that such findings are plagued by “social desirability” effects and self-censorship on the part of respondents. Instead he undertakes a set of in-depth, open-ended interviews with college students at a major midwestern university conducted by same-race interviewers. He uncovers a set of beliefs that he refers to as “color-blind racism.” Bonilla-Silva argues that, while explicit racism is taboo, it has been replaced by a perspective in which whites claim that their racial position places them at a social disadvantage.

Braverman, Harry. Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century. New York: Monthly Review Press, 1975. Braverman applies Marxian theory to argue that technology upgrades in industry are used by owners of capital to reduce the number of employees needed and to reduce the skill level (and value) of remaining employees.

Coleman, James S. *Foundations of Social Theory*. Cambridge, MA: Harvard University Press, 1990. Considered a landmark in sociological theory, Coleman's study provides a framework relating the behavior of individuals to organizational behavior and to society as a whole.

Collins, Patricia Hill. *Black Feminist Thought: Knowledge, Consciousness and the Politics of Empowerment*. Boston: Unwin Hyman, 1990. Revised. New York: Routledge, 2000. Collins provides a history and outline of contemporary black feminist thought through the use of source material that includes music, literature, oral history, and academic research. Her work is built upon three main tenets: that oppressions are interconnected; that the need for self-definition has required women of color to create alternative worldviews; and that externalities such as standards of beauty and success have been racialized in favor of white women. She then examines how race intersects with gender to create narrowly defined roles for African American women.

Lieberson, Stanley. *A Piece of the Pie: Blacks and White Immigrants Since 1880*. Berkeley, CA: University of California Press, 1980. Lieberson is concerned with the origins of group-based inequality in America, which he dates back to the arrival of "new" European immigrants in the late nineteenth and early twentieth centuries. Both the European immigrants and American-born blacks were competing for "a piece of the pie," including housing and work, as they moved from rural to urban environments. Studying a number of explanations for the European immigrants' greater economic success since the Hayes-Tilden Compromise of 1876, he dismisses cultural explanations and discusses residential segregation, labor market discrimination, and the timing of migration to urban areas as critical factors.

Oliver, Melvin L. and Thomas M. Shapiro. *Black Wealth/White Wealth: A New Perspective on Racial Inequality*. New York: Routledge, 1995. An instant classic, Oliver and Shapiro's study of race, wealth, and inequality provides the empirical case that shows that wealth disparity—rather than income disparity—is central to understanding racial inequality in the United States.

Steinberg, Stephen. *The Ethnic Myth: Race, Ethnicity and Class in America*. New York: Atheneum, 1981. Steinberg rejects the view that culture and ethnicity are the primary determinants of economic success for minority groups in America, contending that locality, class conflict, and other socio-economic factors are of much greater consequence.

Walker, Pat, ed. *Between Labor and Capital*. Boston: South End Press, 1979. This anthology of essays centers on the theory of the emergence and potential rise to dominance of a third class in advanced capitalist society, the professional-managerial class.
